# $4-\mathrm{Mb}$ (128K x 36) Flow-through SRAM with NoBL ${ }^{\text {TM }}$ Architecture 

## Features

- Can support up to $133-\mathrm{MHz}$ bus operations with zero wait states
- Data is transferred on every clock
- Pin compatible and functionally equivalent to ZBT ${ }^{\text {TM }}$ devices
- Internally self-timed output buffer control to eliminate the need to use $\overline{\mathrm{OE}}$
- Registered inputs for flow-through operation
- Byte Write capability
- $128 \mathrm{~K} \times 36$ common I/O architecture
- $2.5 \mathrm{~V} / 3.3 \mathrm{~V}$ I/O power supply
- Fast clock-to-output times
- 6.5 ns (for $133-\mathrm{MHz}$ device)
- 7.5 ns (for 117-MHz device)
- 8.0 ns (for $100-\mathrm{MHz}$ device)
- 11.0 ns (for $66-\mathrm{MHz}$ device)
- Clock Enable ( $\overline{C E N}$ ) pin to suspend operation
- Synchronous self-timed writes
- Asynchronous Output Enable
- JEDEC-standard 100 TQFP and 119 BGA packages
- Burst Capability—linear or interleaved burst order
- Low standby power

Functional Description ${ }^{[1]}$
The CY7C1351F is a 3.3 V , 128 K x 36 Synchronous Flow-through Burst SRAM designed specifically to support unlimited true back-to-back Read/Write operations without the insertion of wait states. The CY7C1351F is equipped with the advanced No Bus Latency ${ }^{\text {TM }}$ ( $\mathrm{NoBL}^{\text {TM }}$ ) logic required to enable consecutive Read/Write operations with data being transferred on every clock cycle. This feature dramatically improves the throughput of data through the SRAM, especially in systems that require frequent Write-Read transitions.
All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock input is qualified by the Clock Enable ( $\overline{\mathrm{CEN}}$ ) signal, which when deasserted suspends operation and extends the previous clock cycle. Maximum access delay from the clock rise is 6.5 ns ( $133-\mathrm{MHz}$ device).
Write operations are controlled by the four Byte Write Select ( $\overline{\mathrm{BW}}_{[\mathrm{A}: D]}$ ) and a Write Enable ( $\overline{\mathrm{WE}}$ ) input. All writes are conducted with on-chip synchronous self-timed write circuitry.
Three synchronous Chip Enables $\left(\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}\right)$ and an asynchronous Output Enable ( $\overline{\mathrm{OE})}$ provide for easy bank selection and output three-state control. In order to avoid bus contention, the output drivers are synchronously three-stated during the data portion of a write sequence.

## Pin Definitions

| Name | TQFP | BGA | I/O | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\overline{\mathrm{CE}}_{3}$ | 92 | B6 | InputSynchronous | Chip Enable 3 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\mathrm{CE}_{1}$ and $\mathrm{CE}_{2}$ to select/deselect the device. |
| OE | 86 | F4 | InputAsynchronous | Output Enable, asynchronous input, active LOW. Combined with the synchronous logic block inside the device to control the direction of the I/O pins. When LOW, the I/O pins are allowed to behave as outputs. When deasserted HIGH, I/O pins are three-stated, and act as input data pins. $\overline{\mathrm{OE}}$ is masked during the data portion of a write sequence, during the first clock when emerging from a deselected state, when the device has been deselected. |
| $\overline{\mathrm{CEN}}$ | 87 | M4 | InputSynchronous | Clock Enable Input, active LOW. When asserted LOW the Clock signal is recognized by the SRAM. When deasserted HIGH the Clock signal is masked. Since deasserting CEN does not deselect the device, $\overline{\mathrm{CEN}}$ can be used to extend the previous cycle when required. |
| ZZ | 64 | T7 | InputAsynchronous | ZZ "sleep" Input. This active HIGH input places the device in a non-time critical "sleep" condition with data integrity preserved. During normal operation, this pin can be connected to Vss or left floating. |
| $\mathrm{DQ}_{\mathrm{s}}$ | $\begin{aligned} & \hline 52,53,56,57,58, \\ & 59,62,63,68,69, \\ & 72,73,74,75,78, \\ & 79,2,3,6,7,8,9, \\ & 12,13,18,19,22, \\ & 23,24,25,28,29 \end{aligned}$ | $\begin{aligned} & \text { K6,L6,M6,N6, } \\ & \text { K7,L7,N7,P7, } \\ & \text { E6,F6,G6,H6, } \\ & \text { D7,E7,G7,H7, } \\ & \text { D1,E1,G1,H1, } \\ & \text { E2,F2,G2,H2, } \\ & \text { K1,L1,N1,P1, } \\ & \text { K2,L2,M2,N2 } \end{aligned}$ | I/O- <br> Synchronous | Bidirectional Data I/O Lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by address during the clock rise of the read cycle. The direction of the pins is controlled by $\overline{\mathrm{OE}}$ and the internal control logic. When OE is asserted LOW, the pins can behave as outputs. When HIGH, DQ ${ }_{S}$ and DQP $_{[A: D]}$ are placed in a three-state condition. The outputs are automatically three-stated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{\mathrm{OE}}$. |
| $\mathrm{DQP}_{[\mathrm{A}: \mathrm{D}]}$ | 51,80,1,30 | P6,D6,D2,P2 | I/O- <br> Synchronous | Bidirectional Data Parity I/O Lines. Functionally, these signals are identical to $D Q_{S}$. During write sequences, $D Q P_{[A: D]}$ is controlled by $\mathrm{BW}_{[\mathrm{A}: D]}$ correspondingly. |
| MODE | 31 | R3 | Input Strap Pin | Mode Input. Selects the burst order of the device. When tied to Gnd selects linear burst sequence. When tied to $V_{D D}$ or left floating selects interleaved burst sequence. |
| $\mathrm{V}_{\mathrm{DD}}$ | 15,41,65,91 | $\begin{gathered} \mathrm{J} 2, \mathrm{C} 4, \mathrm{~J} 4, \mathrm{R} 4, \\ \mathrm{~J} 6 \end{gathered}$ | Power Supply | Power supply inputs to the core of the device. |

| $\mathrm{V}_{\text {SS }}$ | $\begin{gathered} \text { 5,10,17,21,26, } \\ 40,55,60,67,71, \\ 76,90, \end{gathered}$ | $\begin{gathered} \text { D3,E3,F3,H3, } \\ \text { J3,K3,M3,N3, } \\ \text { P3,D5,E5,F5, } \\ \text { H5,J5,K5,M5, } \\ \text { N5,P5 } \end{gathered}$ | Ground | Ground for the device. |
| NC | $\begin{gathered} 14,16,38,39,42, \\ 43,66,83,84 \end{gathered}$ | B1,C1,R1,T1, T2,U2, U3,A4, D4,G4,L4,U4, U5,T6,U6,B7, C7,R5,R7,T7 | - | No Connects. Not Internally connected to the die. |

## Functional Overview

The CY7C1351F is a synchronous flow-through burst SRAM designed specifically to eliminate wait states during Write-Read transitions. All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock signal is qualified with the Clock Enable input signal (CEN). If CEN is HIGH, the clock signal is not recognized and all internal states are maintained. All synchronous operations are qualified with CEN. Maximum access delay from the clock rise ( $\mathrm{t}_{\mathrm{CDV}}$ ) is 6.5 ns (133-MHz device).
Accesses can be initiated by asserting all three Chip Enables $\left(\mathrm{CE}_{1}, \mathrm{CE}_{2}, \mathrm{CE}_{3}\right.$ ) active at the rising edge of the clock. If Clock Enable ( CEN ) is active LOW and ADV/LD is asserted LOW, the address presented to the device will be latched. The access can either be a read or write operation, depending on the status of the Write Enable ( $\overline{\mathrm{WE}}$ ). $\mathrm{BW}_{[A: D]}$ can be used to conduct byte write operations.
Write operations are qualified by the Write Enable ( $\overline{\mathrm{WE}}$ ). All writes are simplified with on-chip synchronous self-timed write circuitry.
Three synchronous Chip Enables ( $\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}$ ) and an asynchronous Output Enable ( $\overline{\mathrm{OE})}$ simplify depth expansion. All operations (Reads, Writes, and Deselects) are pipelined. ADV/LD should be driven LOW once the device has been deselected in order to load a new address for the next operation.

## Single Read Accesses

A read access is initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2) $\mathrm{CE}_{1}, \mathrm{CE}_{2}$, and $\overline{\mathrm{CE}}_{3}$ are ALL asserted active, (3) the Write Enable input signal $\overline{\mathrm{WE}}$ is deasserted HIGH, and 4) ADV/ $\overline{\mathrm{LD}}$ is asserted LOW. The address presented to the address inputs is latched into the Address Register and presented to the memory array and control logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the output buffers. The data is available within 6.5 $\mathrm{ns}(133-\mathrm{MHz}$ device) provided $\overline{\mathrm{OE}}$ is active LOW. After the first clock of the read access, the output buffers are controlled by $\overline{\mathrm{OE}}$ and the internal control logic. $\overline{\mathrm{OE}}$ must be driven LOW in order for the device to drive out the requested data. On the subsequent clock, another operation (Read/Write/Deselect) can be initiated. When the SRAM is deselected at clock rise by one of the chip enable signals, its output will be three-stated immediately.

## Burst Read Accesses

The CY7C1351F has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four Reads without reasserting the address inputs. ADV/LD must be driven LOW in order to load a new address into the SRAM, as described in the Single Read Access section above. The sequence of the burst counter is determined by the MODE input signal. A LOW input on MODE selects a linear burst mode, a HIGH selects an interleaved burst sequence. Both burst counters use A0 and A1 in the burst sequence, and will wrap around when incremented sufficiently. A HIGH input on ADV/LD will increment the internal burst counter regardless of the state of chip enable inputs or WE. WE is latched at the
beginning of a burst cycle. Therefore, the type of access (Read or Write) is maintained throughout the burst sequence.

## Single Write Accesses

Write access are initiated when the following conditions are satisfied at clock rise: (1) $\overline{C E N}$ is asserted LOW, (2) $\overline{C E}_{1}, \mathrm{CE}_{2}$, and $\overline{\mathrm{CE}}_{3}$ are ALL asserted active, and (3) the write signal $\overline{\mathrm{WE}}$ is asserted LOW. The address presented to the address bus is loaded into the Address Register. The write signals are latched into the Control Logic block. The data lines are automatically three-stated regardless of the state of the $\overline{\mathrm{OE}}$ input signal. This allows the external logic to present the data on DQs and DQP ${ }_{[A: D]}$.
On the next clock rise the data presented to DQs and DQP ${ }_{[A: D]}$ (or a subset for byte write operations, see truth table for details) inputs is latched into the device and the write is complete. Additional accesses (Read/Write/Deselect) can be initiated on this cycle.
The data written during the Write operation is controlled by $\overline{\mathrm{BW}}_{\text {[A:D] }}$ signals. The CY7C1351F provides byte write capability that is described in the truth table. Asserting the Write Enable input (WE) with the selected Byte Write Select input will selectively write to only the desired bytes. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations. Byte write capability has been included in order to greatly simplify Read/Modify/Write sequences, which can be reduced to simple byte write operations.
Because the CY7C1351F is a common I/O device, data should not be driven into the device while the outputs are active. The Output Enable (OE) can be deasserted HIGH before presenting data to the $D Q s$ and $\operatorname{DQP}_{[A: D]}$ inputs. Doing so will three-state the output drivers. As a safety precaution, DQs and $\mathrm{DQP}_{[\mathrm{A}: \mathrm{D}]}$ :are automatically three-stated during the data portion of a write cycle, regardless of the state of OE.

## Burst Write Accesses

The CY7C1351F has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four Write operations without reasserting the address inputs. ADV/LD must be driven LOW in order to load the initial address, as described in the Single Write Access section above. When ADV/LD is driven HIGH on the subsequent clock rise, the Chip Enables $\left(\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}\right.$, and $\left.\overline{\mathrm{CE}}_{3}\right)$ and $\overline{\mathrm{WE}}$ inputs are ignored and the burst counter is incremented. The correct $\mathrm{BW}_{[\mathrm{A}: D]}$ inputs must be driven in each cycle of the burst write, in order to write the correct bytes of data.

## Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. $\mathrm{CE}_{1}$, CE2, and CE 3 , must remain inactive for the duration of $\mathrm{t}_{\mathrm{ZZREC}}$ after the ZZ input returns LOW.

## Notes:

2. $\mathrm{X}=$ Don't Care." H= Logic HIGH, L = Logic LOW. $\overline{\mathrm{BW}} \mathrm{x}=0$ signifies at least one Byte Write Select is active, $\overline{\mathrm{BW}} \mathrm{x}=$ Valid signifies that the desired byte write selects are asserted, see truth table for details.
3. Write is defined by BW $_{[A: D]}$, and WE. See truth table for Read/Write.
4. When a write cycle is detected, all I/Os are three-stated, even during byte writes
5. The DQs and DQP ${ }_{[A: D]}$ pins are controlled by the current cycle and the $\overline{\mathrm{OE}}$ signal. $\overline{\mathrm{OE}}$ is asynchronous and is not sampled with the clock.
6. $\overline{\mathrm{CEN}}=\mathrm{H}$, inserts wait states.
7. Device will power-up deselected and the I/Os in a three-state condition, regardless of $\overline{\mathrm{OE}}$.
8. $\overline{\mathrm{OE}}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle DQs and $\left.\mathrm{DQP} \mathrm{DA}_{[\mathrm{D}} \mathrm{D}\right]=\mathrm{Three}^{\mathrm{OE}}$-state when $\overline{O E}$ is inactive or when the device is deselected, and $D Q s$ and $D Q P_{[A: D]}=$ data when $\overline{O E}$ is active.

## Notes:

10. Overshoot: $\mathrm{V}_{\mathrm{IH}}(\mathrm{AC})<\mathrm{VDD}_{\mathrm{DD}}+1.5 \mathrm{~V}$ (Pulse width less than tcyc/2), undershoot: $\mathrm{V}_{\mathrm{IL}}(\mathrm{AC})>-2 \mathrm{~V}$ (Pulse width less than tcyc/2).
11. $T_{\text {Power-up: Assumes }}$ a linear ramp from $0 V$ to $V_{D D}$ (min.) within 200 ms . During this time $\mathrm{V}_{\mathrm{IH}}<\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{dDQ}}<\mathrm{V}_{\mathrm{dD}}$.

Electrical Characteristics Over the Operating Range (continued) ${ }^{[10,11]}$

| Parameter | Description | Test Conditions |  | Min. | Max. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{I}_{\text {SB3 }}$ | Automatic CE Power-down Current-CMOS Inputs | $\mathrm{V}_{\mathrm{DD}}=$ Max, Device Deselected, <br> $\mathrm{V}_{\text {IN }} \geq \mathrm{V}_{\mathrm{DDQ}}-0.3 \mathrm{~V}$ or $\mathrm{V}_{\text {IN }} \leq 0.3 \mathrm{~V}$, <br> $\mathrm{f}=\mathrm{f}_{\text {MAX }}$, inputs switching | 7.5-ns cycle, 133 MHz |  | 75 | mA |
|  |  |  | 8.5-ns cycle, 117 MHz |  | 70 | mA |
|  |  |  | 10-ns cycle, 100 MHz |  | 65 | mA |
|  |  |  | 15-ns cycle, 66 MHz |  | 45 | mA |
| $\mathrm{I}_{\text {SB } 4}$ | Automatic CE Power-down Current-TTL Inputs | $V_{D D}=$ Max, Device Deselected, <br> $\mathrm{V}_{\mathbb{I N}} \geq \mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V}$ or $\mathrm{V}_{\mathbb{I N}} \leq 0.3 \mathrm{~V}, \mathrm{f}=$ <br> 0 , inputs static | All speeds |  | 45 | mA |

Thermal Resistance ${ }^{[12]}$

| Parameters | Description | Test Conditions | TQFP <br> Package | BGA <br> Package | Unit |
| :---: | :--- | :--- | :---: | :---: | :---: |
| $\Theta_{\mathrm{JA}}$ | Thermal Resistance <br> (Junction to Ambient) | Test conditions follow standard test <br> methods and procedures for measur- <br> ing thermal impedance, per EIA $/$ | 41.83 | 47.63 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
|  | $\Theta_{\mathrm{JC}}$ | Thermal Resistance <br> (Junction to Case) | 9.99 | 11.71 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

## Capacitance ${ }^{[12]}$

| Parameter | Description | Test Conditions | TQFP <br> Package | BGA <br> Package | Unit |
| :--- | :--- | :--- | :---: | :---: | :---: |
| $\mathrm{C}_{\mathrm{IN}}$ | Input Capacitance | $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{f}=1 \mathrm{MHz}$, | 5 | 5 | pF |
| $\mathrm{C}_{\mathrm{CLOCK}}$ | Clock Input Capacitance | $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$ | $\mathrm{~V}_{\mathrm{DDQ}}=3.3 \mathrm{~V}$ | 5 | 5 |
| $\mathrm{C}_{/ / \mathrm{O}}$ | I/O Capacitance |  | 5 | pF |  |
|  |  |  | 7 | pF |  |

Shaded areas contain advance information.

## Notes:

13. This part has a voltage regulator internally; tpower is the time that the power needs to be supplied above VDD minimum initially before a read or write operation can be initiated
14. $\mathrm{t}_{\mathrm{CHZ}}, \mathrm{t}_{\mathrm{CLZ}}, \mathrm{t}_{\mathrm{OELZ}}$, and $\mathrm{t}_{\mathrm{OEHZ}}$ are specified with AC test conditions shown in part (b) of AC Test Loads. Transition is measured $\pm 200 \mathrm{mV}$ from steady-state voltage.
15. At any given voltage and temperature, $\mathrm{t}_{\mathrm{OEHZ}}$ is less than $\mathrm{t}_{\mathrm{OEI}}$ and $\mathrm{t}_{\mathrm{CHZ}}$ is less than $\mathrm{t}_{\mathrm{CIZ}}$ to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve Three-state prior to Low-Z under the same system conditions
16. This parameter is sampled and not $100 \%$ tested.
17. Timing reference level is 1.5 V when $\mathrm{V}_{\mathrm{DDQ}}=3.3 \mathrm{~V}$ and is 1.25 V when $\mathrm{V}_{\mathrm{DDQ}}=2.5 \mathrm{~V}$.
18. Test conditions shown in (a) of AC Test Loads, unless otherwise noted.

Shaded areas contain advance information. Please contain your local sales representative for more information on ordering these parts.
Notes:
19. For this waveform ZZ is tied low.
20. When $\overline{C E}$ is LOW, $\overline{\mathrm{CE}}_{1}$ is LOW, $\mathrm{CE}_{2}$ is HIGH and $\overline{\mathrm{CE}}_{3}$ is LOW . When $\overline{\mathrm{CE}}$ is $\mathrm{HIGH}, \overline{\mathrm{CE}}_{1}$ is HIGH or $\mathrm{CE}_{2}$ is LOW or $\overline{\mathrm{CE}}_{3}$ is HIGH .
21. Order of the Burst sequence is determined by the status of the MODE ( $0=$ Linear, $1=$ Interleaved). Burst operations are optional.
22. The IGNORE CLOCK EDGE or STALL cycle (Clock 3) illustrates CEN being used to create a pause. A write is not performed during this cycle.
23. Device must be deselected when entering $Z Z$ mode. See truth table for all possible signal conditions to deselect the device.
24. DQs are in high- $Z$ when exiting $Z Z$ sleep mode.
