

32-Channel Serial to Parallel Converter With Open Drain Outputs

Features

- ▶ Processed with HVCMOS® technology
- ▶ Output voltages to 225V using a ramped supply voltage
- ▶ SINK current minimum 100mA
- ▶ Shift register speed 8.0MHz
- ▶ Strobe and enable inputs
- ▶ CMOS compatible inputs
- ▶ Forward and reverse shifting options
- ▶ Hi-Rel processing available

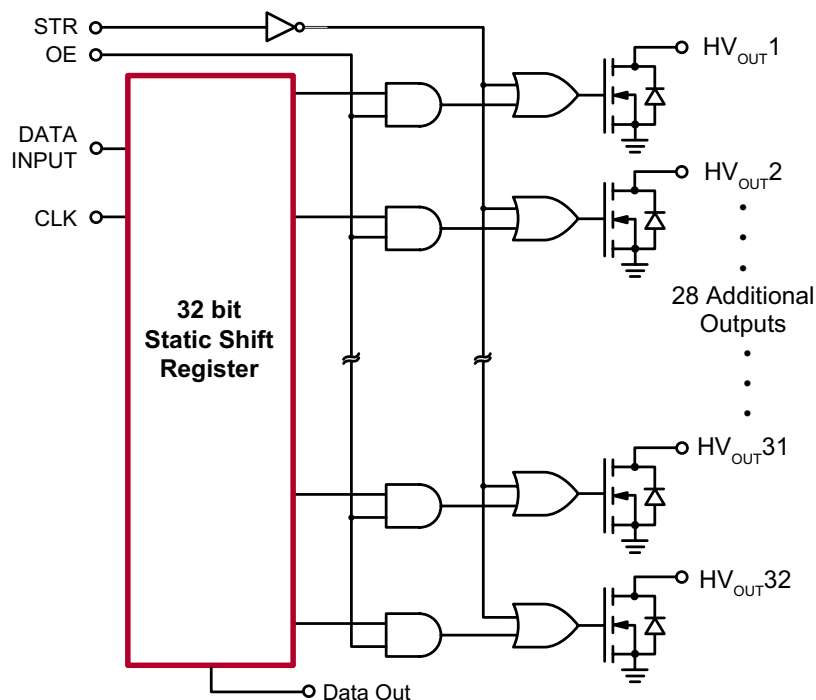

General Description

The HV5122 is a low voltage serial to high voltage parallel converter with open drain outputs. This device has been designed for use as a driver for AC electroluminescent displays. They can also be used in any application requiring multiple output high voltage current sinking capabilities such as driving inkjet and electrostatic print heads, plasma panels, vacuum fluorescent, or large matrix LCD displays.

This device consists of a 32-bit shift register and control logic to perform the Output Enable and all-on functions. Data is shifted through the shift register on the high to low transition of the clock. The HV5122 shifts in the counter-clockwise direction when viewed from the top of the package. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register. Operation of the shift register is not affected by the OE(Output Enable) or the STR(Strobe) inputs.

The HV5122 has been designed to be used in systems which either switch off the high voltage supply before changing the state of the high voltage outputs or which limit the current through each output.

Absolute Maximum Ratings

Parameter	Value
Supply voltage, V _{DD}	-0.5V to +15V
Supply voltage, V _{PP}	-0.5V to +250V
Logic input levels	-0.5V to V _{DD} +0.5V
Ground current ¹	1.5A
Continuous total power dissipation ²	
Plastic	1200W
Ceramic	1500W
Operating temperature range	
Plastic	-40°C to +85°C
Ceramic	-55°C to +125°C
Storage temperature range	-65°C to +150°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

Notes:

- 1. Duty cycle is limited by the total power dissipated in the package.
- 2. For operation above 25°C ambient derate linearly to maximum operating temperature at 20mW/°C for plastic and at 15mW/°C for ceramic.

Power-Up Sequence

Power-up sequence should be the following:

1. Connect ground
2. Apply V_{DD}
3. Set all inputs to a known state

Power-down sequence should be the reverse of the above.
