

10 W car radio audio amplifier

Features

- Improved performance over the TDA2002 (pin-to-pin compatible)
- Very low number of external components
- Ease of assembly
- Cost and space savings

Description

The TDA2003A is capable of providing a high output current (up to 3.5 A) with very low harmonic and crossover distortion.

Completely safe operation is guaranteed due to DC and AC short-circuit protection between all pins and ground, a thermal limiting circuit, load dump voltage surge protection up to 40 V and protection diodes in case of accidental open ground.

3 Application information

Figure 20. Typical application circuit

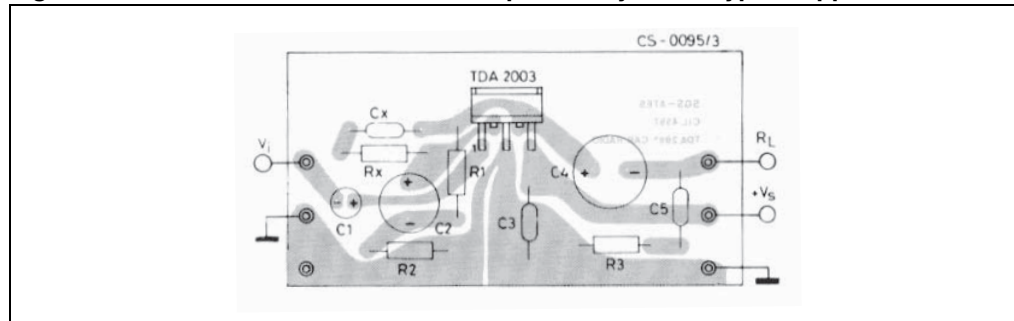

Figure 21. Printed circuit board and component layout for typical application circuit

3.1 Built-in protection systems

3.1.1 Load dump voltage surge

The TDA2003A has a circuit which enables it to withstand a voltage pulse train, on pin 5, of the type shown in [Figure 23](#).

If the supply voltage peaks to more than 40 V, then an LC filter must be inserted between the supply and pin 5, in order to ensure that the pulses at pin 5 will be held within the limits shown in [Figure 22](#).

A recommended LC network is shown in [Figure 23](#). With this network, a train of pulses with amplitude up to 120 V and width of 2 ms can be applied at point A.

This type of protection is ON when the supply voltage (pulsed or DC) exceeds 18 V. For this reason the maximum operating supply voltage is 18 V.

Figure 22. Voltage gain bridge configuration**Figure 23. Suggested LC network circuit**

3.1.2 Short-circuit (AC and DC conditions)

The TDA2003A can withstand a permanent short-circuit on the output for a supply voltage up to 16 V.

3.1.3 Polarity inversion

High current (up to 5 A) can be handled by the device with no damage for a longer period than the blow-out time of a quick 1 A fuse (normally connected in series with the supply).

This feature is added to avoid destruction if, during fitting to the car, a mistake on the connection of the supply is made.

3.1.4 Open ground

When the radio is in the ON condition and the ground is accidentally opened, a standard audio amplifier will be damaged. On the TDA2003A, protection diodes are included to avoid any damage.

3.1.5 Inductive load

A protection diode is provided between pin 4 and 5 (see the internal schematic diagram) to allow use of the TDA2003A with inductive loads. In particular, the TDA2003A can drive a coupling transformer for audio modulation.

3.1.6 DC voltage

The maximum operating DC voltage on the TDA2003A is 18 V, however the device can withstand a DC voltage up to 28 V with no damage. This could occur during winter if two batteries were connected in series to crank the engine.

3.1.7 Thermal shutdown

The presence of a thermal limiting circuit offers the following advantages:

1. An overload on the output (even if it is permanent), or an excessive ambient temperature can be easily withstood.
2. The heatsink can have a smaller factor compared with that of a conventional circuit. There is no damage to the device in the case of excessive junction temperature: only P_o (and therefore P_{tot}) and I_d are reduced.

Figure 24. Output power and drain current vs. case temperature ($R_L = 4 \Omega$) **Figure 25. Output power and drain current vs. case temperature ($R_L = 2 \Omega$)**

3.2 Practical considerations

3.2.1 Printed circuit board

The layout shown in [Figure 21](#) is recommended. If different layouts are used, the ground points of input 1 and input 2 must be well decoupled from the ground of the output through which a rather high current flows.

3.2.2 Assembly recommendations

No electrical insulation is required between the package and the heatsink. Pin length should be as short as possible. The soldering temperature must not exceed $260^{\circ}C$ for 12 seconds.

3.2.3 Application recommendations

The recommended component values are those shown in the application circuit in [Figure 20](#). Different values can be used. The following table is intended to aid the car-radio designer.

Table 5. Recommended values of the components of a bridge application circuit

Component	Recommended value	Purpose	Larger than recommended value	Smaller than recommended value C1
C1	2.2 μ F	Input DC decoupling	-	Noise at switch-on, switch-off
C2	470 μ F	Ripple rejection	-	Degradation of SVR
C3	0.1 μ F	Supply bypassing	-	Danger of oscillation
C4	1000 μ F	Output coupling to load	-	Higher low frequency cutoff
C5	0.1 μ F	Frequency stability	-	Danger of oscillation at high frequencies with inductive loads
C _x	$\cong \frac{1}{2\pi BR1}$	Upper frequency cutoff	Lower bandwidth	Larger bandwidth
R1	(Gv-1). R2	Setting of gain	-	Increase of drain current
R2	2.2 Ω	Setting of gain and SVR	Degradation of SVR	-
R3	1 Ω	Frequency stability	Danger of oscillation at high frequencies with inductive loads	-
R _x	$\cong 20 R2$	Upper frequency cutoff	Poor high frequency attenuation	Danger of oscillation

4 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com.

ECOPACK® is an ST trademark.
