Frequency (MHz)		33.3	33.3	28.5	20	12.5
Maximum Access Time (ns)		15	20	25	40	65
Maximum Operating Current (mA)	Commercial	105		90		
	Military		110	95		

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ..... -65°C to +150°C

Ambient Temperature with Power Applied..... -55°C to +125°C

Supply Voltage to Ground Potential ..... -0.5V to +7.0V

DC Voltage Applied to Outputs in High Z State ..... -0.5V to +7.0V

DC Input Voltage..... -3.0V to +7.0V

Power Dissipation ..... 1.0W

Output Current, into Outputs (LOW) ..... 20 mA

Static Discharge Voltage ..... >2001V  
(per MIL-STD-883, Method 3015)

Latch-Up Current..... >200 mA

## Operating Range

Range	Ambient Temperature	V <sub>CC</sub>
Commercial	0°C to +70°C	5V ± 10%
Industrial	-40°C to +85°C	5V ± 10%
Military <sup>[1]</sup>	-55°C to +125°C	5V ± 10%

Note:

1. T<sub>A</sub> is the "instant on" case temperature.

## Electrical Characteristics Over the Operating Range<sup>[2]</sup>

**Note:**

 12. Expansion out of device 1 ( $\bar{XO}_1$ ) is connected to expansion in of device 2 ( $\bar{XI}_2$ ).

## Architecture

### Resetting the FIFO

Upon power up, the FIFO must be reset with a master reset ( $\overline{MR}$ ) cycle. This causes the FIFO to enter the empty condition signified by the Empty flag ( $\overline{EF}$ ) being LOW, and both the Half Full ( $\overline{HF}$ ), and Full flags ( $\overline{FF}$ ) being HIGH. Read ( $\overline{R}$ ) and write ( $\overline{W}$ ) must be HIGH  $t_{RPW}/t_{WPW}$  before and  $t_{RMR}$  after the rising edge of  $\overline{MR}$  for a valid reset cycle. If reading from the FIFO after a reset cycle is attempted, the outputs will all be in the high-impedance state.

### Writing Data to the FIFO

The availability of at least one empty location is indicated by a HIGH  $\overline{FF}$ . The falling edge of  $\overline{W}$  initiates a write cycle. Data appearing at the inputs ( $D_0 - D_8$ )  $t_{SD}$  before and  $t_{HD}$  after the rising edge of  $\overline{W}$  will be stored sequentially in the FIFO.

The  $\overline{EF}$  LOW-to-HIGH transition occurs  $t_{WEF}$  after the first LOW-to-HIGH transition of  $\overline{W}$  for an empty FIFO.  $\overline{HF}$  goes LOW  $t_{WHF}$  after the falling edge of  $\overline{W}$  following the FIFO actually being half full. Therefore, the  $\overline{HF}$  is active once the FIFO is filled to half its capacity plus one word.  $\overline{HF}$  will remain LOW while less than one half of total memory is available for writing. The LOW-to-HIGH transition of  $\overline{HF}$  occurs  $t_{RHF}$  after the rising edge of  $\overline{R}$  when the FIFO goes from half full +1 to half full.  $\overline{HF}$  is available in standalone and width expansion modes.  $\overline{FF}$  goes LOW  $t_{WFF}$  after the falling edge of  $\overline{W}$ , during the cycle in which the last available location is filled. Internal logic prevents overrunning a full FIFO. Writes to a full FIFO are ignored and the write pointer is not incremented.  $\overline{FF}$  goes HIGH  $t_{RFF}$  after a read from a full FIFO.

### Reading Data from the FIFO

The falling edge of  $\overline{R}$  initiates a read cycle if the  $\overline{EF}$  is not LOW. Data outputs ( $Q_0 - Q_8$ ) are in a high-impedance condition between read operations ( $\overline{R}$  HIGH), when the FIFO is empty, or when the FIFO is not the active device in the depth expansion mode.

When one word is in the FIFO, the falling edge of  $\overline{R}$  initiates a HIGH-to-LOW transition of  $\overline{EF}$ . When the FIFO is empty, the outputs are in a high-impedance state. Reads to an empty FIFO are ignored and do not increment the read pointer. From the empty condition, the FIFO can be read  $t_{WEF}$  after a valid write.

### Retransmit

The retransmit feature is beneficial when transferring packets of data. It enables the receipt of data to be acknowledged by the receiver and retransmitted if necessary. The retransmit ( $\overline{RT}$ ) input is active in the standalone and width expansion modes. The retransmit feature is intended for use when a number of writes equal-to-or-less-than the depth of the FIFO have occurred since the last  $\overline{MR}$  cycle. A LOW pulse on  $\overline{RT}$  resets the internal read pointer to the first physical location of the FIFO.  $\overline{R}$  and  $\overline{W}$  must both be HIGH while and  $t_{RTR}$  after retransmit is LOW. With every read cycle after retransmit, previously accessed data is read and the read pointer incremented until equal to the write pointer. Full, Half Full, and Empty flags are governed by the relative locations of the read and write pointers and are updated during a retransmit cycle. Data written to the FIFO after activation of  $\overline{RT}$  are transmitted also.

The full depth of the FIFO can be repeatedly retransmitted.

### Standalone/Width Expansion Modes

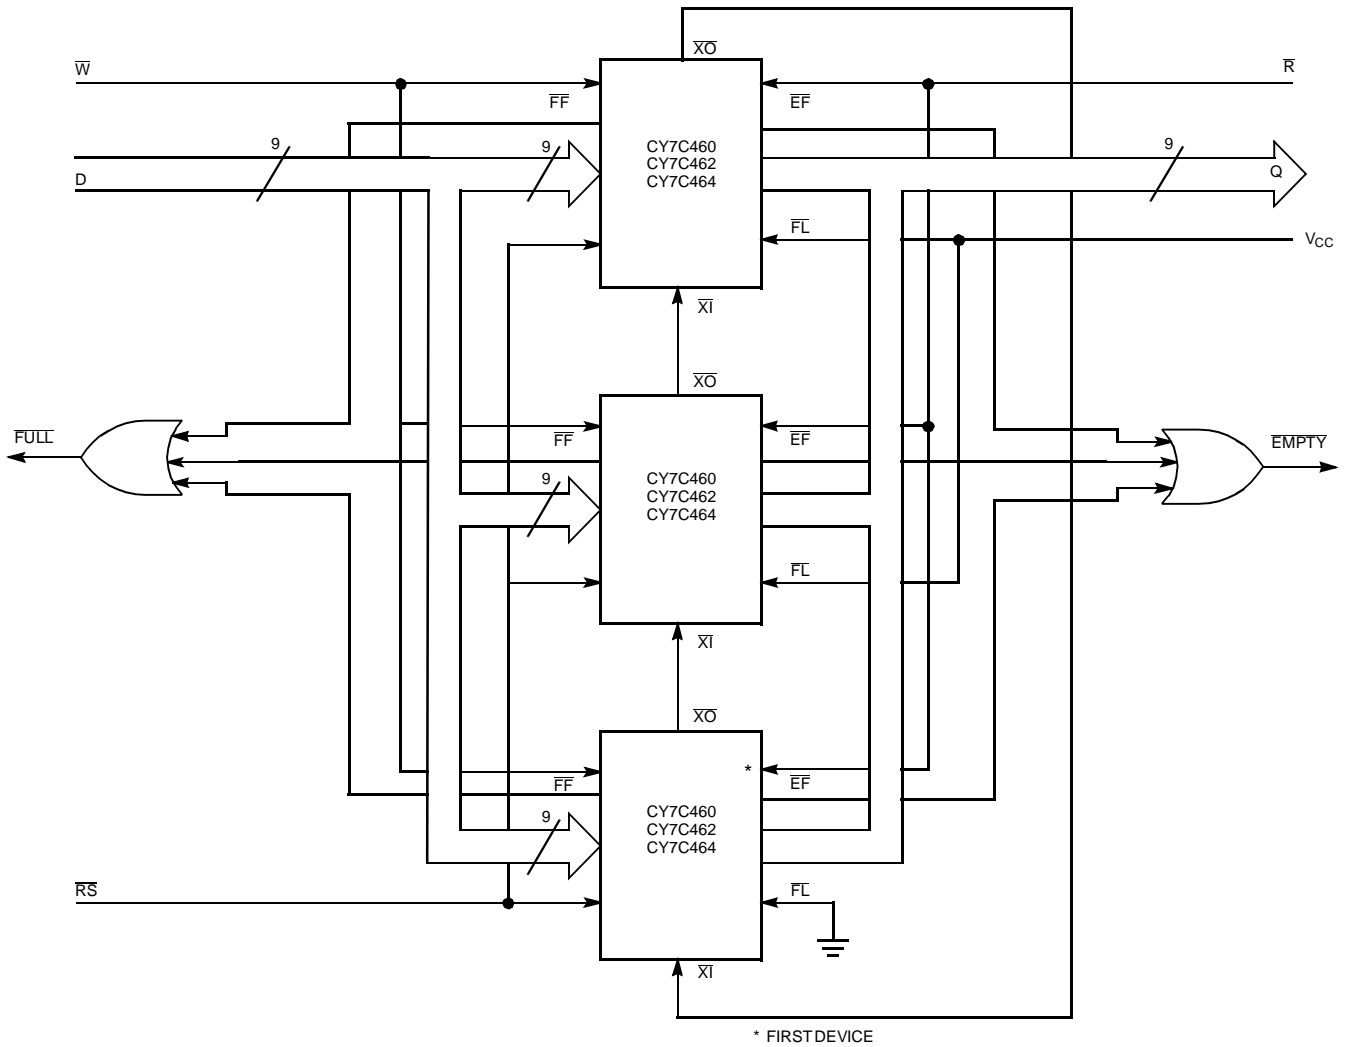

Standalone and width expansion modes are set by grounding expansion in ( $\overline{XI}$ ) and tying first load ( $\overline{FL}$ ) to  $V_{CC}$  prior to a  $\overline{MR}$  cycle. FIFOs can be expanded in width to provide word widths greater than nine in increments of nine. During width expansion mode, all control line inputs are common to all devices, and flag outputs from any device can be monitored.

### Depth Expansion Mode (see Figure 1)

Depth expansion mode is entered when, during a  $\overline{MR}$  cycle, expansion out ( $\overline{XO}$ ) of one device is connected to expansion in ( $\overline{XI}$ ) of the next device, with  $\overline{XO}$  of the last device connected to  $\overline{XI}$  of the first device. In the depth expansion mode, the first load ( $\overline{FL}$ ) input, when grounded, indicates that this is the first part to be loaded. All other devices must have this pin HIGH. To enable the correct FIFO,  $\overline{XO}$  is pulsed LOW when the last physical location of the previous FIFO is written to and is pulsed LOW again when the last physical location is read. Only one FIFO is enabled for read and one is enabled for write at any given time. All other devices are in standby.

FIFOs can also be expanded simultaneously in depth and width. Consequently, any depth or width FIFO can be created with word widths in increments of nine. When expanding in depth, a composite  $\overline{FF}$  is created by ORing the  $\overline{FF}$ s together. Likewise, a composite  $\overline{EF}$  is created by ORing  $\overline{EF}$ s together.  $\overline{HF}$  and  $\overline{RT}$  functions are not available in depth expansion mode.
