## PS51259-A

### INTEGRATED POWER FUNCTIONS

- Single phase AC input, DC output IGBT/FWD converter bridge
- 600V, 20Arms (Input current)

### INTEGRATED DRIVE, PROTECTION AND SYSTEM CONTROL FUNCTIONS

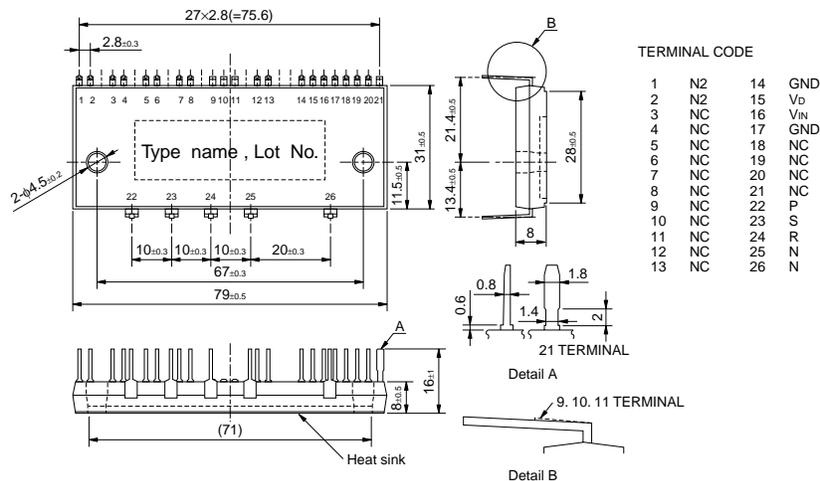

- IGBTs driver circuit
- Control supply under-voltage (UV) protection
- Input interface : 5~15V line CMOS/TTL compatible, Schmitt Trigger receiver circuit (Active high)

## APPLICATION

AC100~200V Active-Converter for PFC (Power Factor Correction), of Air-conditioner and so on.

Fig. 2 THE DIP-PFC INTERNAL CIRCUIT

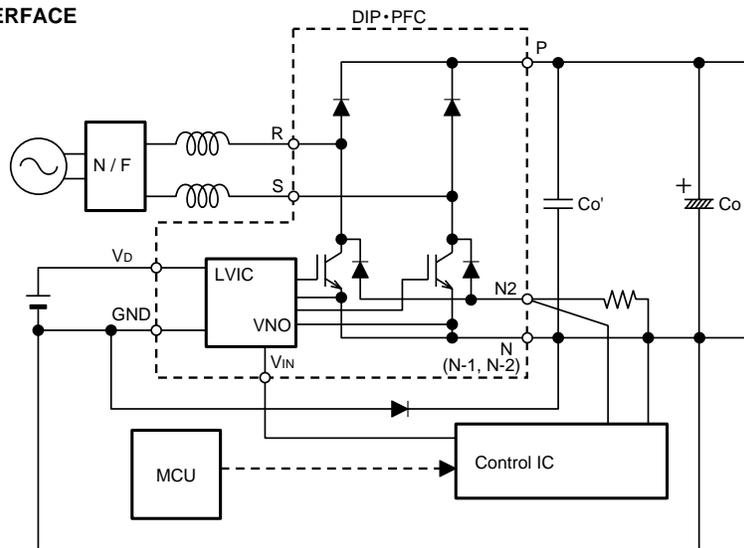

**DIP-PFC Wiring Guidelines**

Because DIP-PFC switches large current at a very high speed, considerable large surge voltage is generated easily between P and N terminals. Please pay attention to the following items:

- The area of P-Co-N shown in Fig. 3 should be as small as possible because the rectangle shaped switching current flows on this route. In addition, please add a bypass condenser  $Co'$  with good frequency response such as a polypropylene film condenser closely to the P and N terminals.
- The two IGBT emitters are connected to the VNO terminal of LVIC inside the DIP-PFC. If the internal wiring inductance shown as  $L1$  and  $L2$  in Fig. 4 is too large, large surge voltage will be generated by  $di/dt$ . Especially, the lower the temperature, the faster the switching speed, therefore the larger the  $di/dt$ . This surge voltage applies to the VNO and N terminals, which is possible to destruct LVIC.
- In order to suppress the surge voltage, the external wiring method shown in Fig. 4 is recommended. To reduce the parasitic wiring inductance, the wiring of the external terminals of N(N-1) and N(N-2) should be made as short as possible.
- Please mount a fast clamp diode (EG01Y@Sanken) between N and control GND terminals to prevent control GND potential variation from the minus voltage of N terminal.
