# MIC5255 

## 150mA Low Noise $\mu$ Cap CMOS LDO

## General Description

The MIC5255 is an efficient, precise CMOS voltage regulator optimized for ultra-low-noise applications. It offers 1\% initial accuracy, extremely-low dropout voltage ( 135 mV at 150 mA ) and low ground current (typically $90 \mu \mathrm{~A}$ ). The MIC5255 provides a very-low-noise output, ideal for RF applications where a clean voltage source is required. A noise bypass pin is also available for further reduction of output noise.
Designed specifically for handheld and battery-powered devices, the MIC5255 provides a TTL-logic-compatible enable pin. When disabled, power consumption drops nearly to zero.
The MIC5255 also works with low-ESR ceramic capacitors, reducing the amount of board space necessary for power applications, critical in handheld wireless devices.
Key features include current limit, thermal shutdown, faster transient response, and an active clamp to speed up device turn-off. Available in the 6 -pin $2 \mathrm{~mm} \times 2 \mathrm{~mm}$ MLFTM package, the IttyBitty ${ }^{\text {B }}$ SOT-23-5 package and the new Thin SOT-235 , which offers the same footprint as the standard IttyBitty ${ }^{\circledR}$ SOT-23-5, but only 1 mm tall. The MIC5255 offers a range of output voltages.
All support documentation can be found on Micrel's web site at www.micrel.com.

## Features

- Input voltage range: 2.7 V to 6.0 V
- Thin SOT package: 1 mm height SOT-23-5
- Ultra-low output noise: $30 \mu \mathrm{~V}$ (rms)
- Stability with ceramic output capacitors
- Ultra-low dropout: 135mV @ 150mA
- High output accuracy:
1.0\% initial accuracy
2.0\% over temperature
- Low quiescent current: $90 \mu \mathrm{~A}$
- Tight load and line regulation
- TTL-Logic-controlled enable input
- "Zero" off-mode current
- Thermal shutdown and current limit protection

## Applications

- Cellular phones and pagers
- Cellular accessories
- Battery-powered equipment
- Laptop, notebook, and palmtop computers
- Consumer/personal electronics

## Typical Application

Ultra-Low-Noise Regulator Application

## Notes:

1. Exceeding the absolute maximum rating may damage the device.
2. The device is not guaranteed to function outside its operating rating.
3. The maximum allowable power dissipation of any $T_{A}$ (ambient temperature) is $P_{D}(\max )=\left(T_{J}(m a x)-T_{A}\right) / \theta_{J A}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. The $\theta_{\mathrm{JA}}$ of the MIC5255-x.xBM5 (all versions) is $235^{\circ} \mathrm{C} / \mathrm{W}$ on a PC board. See "Thermal Considerations" section for further details.
4. Devices are ESD sensitive. Handling precautions recommended.
5. Specification for packaged product only.
6. Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1 mA to 150 mA . Changes in output voltage due to heating effects are covered by the thermal regulation specification.
7. Dropout Voltage is defined as the input-to-output differential at which the output voltage drops $2 \%$ below its nominal value measured at 1 V differential. For outputs below 2.7 V , dropout voltage is the input-to-output voltage differential with the minimum input voltage 2.7 V . Minimum input operating voltage is 2.7 V .
8. Ground pin current is the regulator quiescent current. The total current drawn from the supply is the sum of the load current plus the ground pin current.

## Block Diagram

## Applications Information

## Enable/Shutdown

The MIC5255 comes with an active-high enable pin that allows the regulator to be disabled. Forcing the enable pin low disables the regulator and sends it into a "zero" off-modecurrent state. In this state, current consumed by the regulator goes nearly to zero. Forcing the enable pin high enables the output voltage. This part is CMOS and the enable pin cannot be left floating; a floating enable pin may cause an indeterminate state on the output.

## Input Capacitor

The MIC5255 is a high performance, high bandwidth device. Therefore, it requires a well-bypassed input supply for optimal performance. A $1 \mu \mathrm{~F}$ capacitor is required from the input to ground to provide stability. Low-ESR ceramic capacitors provide optimal performance at a minimum of space. Additional high frequency capacitors, such as small valued NPO dielectric type capacitors, help filter out high frequency noise and are good practice in any RF-based circuit.

## Output Capacitor

The MIC5255 requires an output capacitor for stability. The design requires $1 \mu \mathrm{~F}$ or greater on the output to maintain stability. The design is optimized for use with low-ESR ceramic chip capacitors. High ESR capacitors may cause high frequency oscillation. The maximum recommended ESR is $300 \mathrm{~m} \Omega$. The output capacitor can be increased, but performance has been optimized for a $1 \mu \mathrm{~F}$ ceramic output capacitor and does not improve significantly with larger capacitance.
X7R/X5R dielectric-type ceramic capacitors are recommended because of their temperature performance. X7Rtype capacitors change capacitance by $15 \%$ over their operating temperature range and are the most stable type of ceramic capacitors. Z 5 U and Y 5 V dielectric capacitors change value by as much as $50 \%$ and $60 \%$, respectively, over their operating temperature ranges. To use a ceramic chip capacitor with Y 5 V dielectric, the value must be much higher than an X7R ceramic capacitor to ensure the same minimum capacitance over the equivalent operating temperature range.

## Bypass Capacitor

A capacitor can be placed from the noise bypass pin to ground to reduce output voltage noise. The capacitor bypasses the internal reference. A $0.01 \mu \mathrm{~F}$ capacitor is recommended for applications that require low-noise outputs. The bypass capacitor can be increased, further reducing noise and improving PSRR. Turn-on time increases slightly with respect to bypass capacitance. A unique quick-start circuit allows the MIC5255 to drive a large capacitor on the bypass pin without significantly slowing turn-on time. Refer to the "Typical Characteristics" section for performance with different bypass capacitors.

## Active Shutdown

The MIC5255 also features an active shutdown clamp, which is an N-Channel MOSFET that turns on when the device is disabled. This allows the output capacitor and load to discharge, de-energizing the load.

## No-Load Stability

The MIC5255 will remain stable and in regulation with no load unlike many other voltage regulators. This is especially important in CMOS RAM keep-alive applications.

## Thermal Considerations

The MIC5255 is designed to provide 150 mA of continuous current in a very small package. Maximum power dissipation can be calculated based on the output current and the voltage drop across the part. To determine the maximum power dissipation of the package, use the junction-to-ambient thermal resistance of the device and the following basic equation:

$$
P_{D}(\max )=\left(\frac{T_{J}(\max )-T_{A}}{\theta_{\mathrm{JA}}}\right)
$$

$T_{J}(\max )$ is the maximum junction temperature of the die, $125^{\circ} \mathrm{C}$, and $\mathrm{T}_{\mathrm{A}}$ is the ambient operating temperature. $\theta_{\mathrm{JA}}$ is layout dependent; Table 1 shows examples of junction-toambient thermal resistance for the MIC5255.

| Package | $\boldsymbol{\theta}_{\text {JA }}$ Recommended <br> Minimum Footprint | $\boldsymbol{\theta}_{\text {JA }} \mathbf{1 " ~}^{\text {1" Square }}$ <br> Copper Clad | $\boldsymbol{\theta}_{\text {JC }}$ |
| :---: | :---: | :---: | :---: |
| SOT-23-5 <br> (M5 or D5) | $235^{\circ} \mathrm{C} / \mathrm{W}$ | $185^{\circ} \mathrm{C} / \mathrm{W}$ | $145^{\circ} \mathrm{C} / \mathrm{W}$ |

Table 1. SOT-23-5 Thermal Resistance
The actual power dissipation of the regulator circuit can be determined using the equation:

$$
P_{D}=\left(V_{I N}-V_{\text {OUT }}\right) I_{\text {OUT }}+V_{\text {IN }} I_{G N D}
$$

Substituting $\mathrm{P}_{\mathrm{D}}(\max )$ for $\mathrm{P}_{\mathrm{D}}$ and solving for the operating conditions that are critical to the application will give the maximum operating conditions for the regulator circuit. For example, when operating the MIC5255-3.0BM5 at $50^{\circ} \mathrm{C}$ with a minimum footprint layout, the maximum input voltage for a set output current can be determined as follows:

$$
\begin{aligned}
& P_{D}(\max )=\left(\frac{125^{\circ} \mathrm{C}-50^{\circ} \mathrm{C}}{235^{\circ} \mathrm{C} / \mathrm{W}}\right) \\
& \mathrm{P}_{\mathrm{D}}(\max )=315 \mathrm{~mW}
\end{aligned}
$$

The junction-to-ambient thermal resistance for the minimum footprint is $235^{\circ} \mathrm{C} / \mathrm{W}$, from Table 1. The maximum power dissipation must not be exceeded for proper operation. Using the output voltage of 3.0 V and an output current of 150 mA , the maximum input voltage can be determined. Because this device is CMOS and the ground current is typically $100 \mu \mathrm{~A}$ over the load range, the power dissipation contributed by the ground current is < $1 \%$ and can be ignored for this calculation:

$$
\begin{aligned}
& 315 \mathrm{~mW}=\left(\mathrm{V}_{\mathbb{I N}}-3.0 \mathrm{~V}\right) 150 \mathrm{~mA} \\
& 315 \mathrm{~mW}=\mathrm{V}_{\mathbb{I N}} \times 150 \mathrm{~mA}-450 \mathrm{~mW} \\
& 810 \mathrm{~mW}=\mathrm{V}_{\mathrm{IN}} \times 150 \mathrm{~mA} \\
& \mathrm{~V}_{\text {IN }}(\mathrm{max})=5.4 \mathrm{~V}
\end{aligned}
$$

Therefore, a 3.0 V application at 150 mA of output current can accept a maximum input voltage of 5.4 V in a SOT-23-5 package. For a full discussion of heat sinking and thermal effects on voltage regulators, refer to the "Regulator Therma/s" section of Micrel's Designing with Low-Dropout Voltage Regulators handbook.

## Package Information

DIMENSIONS:
MM (INCH)

SOT-23-5 (M5)

NOTE:

1. Dimensions and tolerances are as per ANSI Y14.5M, 1994.
2. Die is facing up for mold. Die is facing down for trim/form, ie, reverse trim/form.
©. Dimensions are exclusive of mold flash and gate burr.
3. The footlength measuring is based on the gauge plane method.
4. All specification comply to Jedec Spec M0193 Issue C.
5. All dimensions are in millimeters.

Rev 02
