

TOSHIBA CCD LINEAR IMAGE SENSOR CCD(Charge Coupled Device)

# TCD2252D

The TCD2252D is a high sensitive and low dark current 2700 elements×3 line CCD color image sensor. The sensor is designed for color scanner. The device contains a row of 2700 elements×3 line photodiodes which provide a 12 lines/mm across a A4 size paper. The device is operated by 5V pulse, and 12V power supply.

**FEATURES**

- Number of Image Sensing Elements : 2700 elements×3 line
- Image Sensing Element Size : 8μm by 8μm on 8μm centers
- Photo Sensing Region : High sensitive pn photodiode
- Distance Between Photodiode Array : 64μm (8 Lines)
- Clock : 2 phase (5V)
- Internal Circuit : Sample and Hold circuit, Clamp circuit
- Package : 22 pin DPI CERDIP package
- Color Filter : Red, Green, Blue

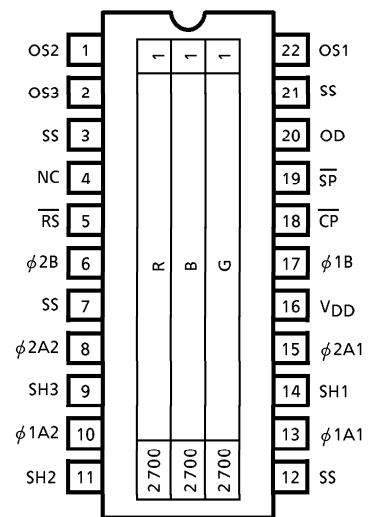

Weight : 4.5g (Typ.)

**MAXIMUM RATINGS (Note 1)**

CHARACTERISTIC	SYMBOL	RATING	UNIT
Clock Pulse Voltage	$V_{\phi}$	- 0.3~8	V
Shift Pulse Voltage	$V_{SH}$		V
Reset Pulse Voltage	$V_{RS}$		V
Sample and Hold Pulse Voltage	$V_{SP}$		V
Clamp Pulse Voltage	$V_{CP}$		V
Power Supply Voltage	$V_{OD}$ $V_{DD}$	- 0.3~15	V
Operating Temperature	$T_{opr}$	0~60	°C
Storage Temperature	$T_{stg}$	- 25~85	°C

(Note 1) All voltage are with respect to SS terminals (Ground).

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

(Note 2) Sensitivity is defined for each color of signal outputs average when the photosensitive surface is applied with the light of uniform illumination and uniform color temperature.

(Note 3) PRNU (1) is defined for each color on a single chip by the expressions below when the photosensitive surface is applied with the light of uniform illumination and uniform color temperature.

$$PRNU (1) = \frac{\Delta\bar{x}}{\bar{x}} \times 100 (\%)$$

Where  $\bar{x}$  is average of total signal outputs and  $\Delta\bar{x}$  is the maximum deviation from  $\bar{x}$ . The amount of the incident light is shown below.

$$\begin{aligned} \text{Red} &= \frac{1}{2} \text{ SE} \\ \text{Green} &= \frac{1}{2} \text{ SE} \\ \text{Blue} &= \frac{1}{4} \text{ SE} \end{aligned}$$

(Note 4) PRNU (3) is defined as maximum voltage difference between two adjacent pixels, where measured at 50mV (Typ.).

(Note 5) RI is defined for each color on a single chip by the expressions below when the photosensitive surface is applied with the light of uniform illumination and uniform color temperature.

$$RI = \frac{\sum_{n=1}^{2699} |x_n - x_{n+1}|}{2699 \cdot \bar{x}} \times 100 (\%)$$

Where  $x_n$  and  $x_{n+1}$  are signal outputs of each pixel.  $\bar{x}$  is average of signal outputs of all effective pixels.

(Note 6)  $V_{SAT}$  is defined as minimum Saturation Output Voltage of all effective pixels.

(Note 7) Definition of SE :  $SE = \frac{V_{SAT}}{R_G} (lx \cdot s)$

(Note 8)  $V_{DRK}$  is defined as average dark signal voltage of all effective pixels.

(Note 9) DSNU is defined as different voltage between  $V_{DRK}$  and  $V_{MDK}$ , when  $V_{MDK}$  is maximum dark voltage.

(Note 10) DC Signal Output Voltage is defined as follows:

(Note 11) Random noise is defined as the standard deviation (sigma) of the output level difference between two adjacent effective pixels under no illumination (i.e. dark condition) calculated by the following procedure.

- 1) Two adjacent pixels (pixel n and n + 1) in one reading are fixed as measurement points.
- 2) Each of the output levels at video output periods averaged over 200 nanosecond period to get  $V_n$  and  $V_{n+1}$ .
- 3)  $V_{n+1}$  is subtracted from  $V_n$  to get  $\Delta V$ .  

$$\Delta V = V_n - V_{n+1}$$
- 4) The standard deviation of  $\Delta V$  is calculated after procedure 2) and 3) are repeated 30 times (30 readings).

$$\overline{\Delta V} = \frac{1}{30} \sum_{i=1}^{30} |\Delta V_i| \quad \sigma = \sqrt{\frac{1}{30} \sum_{i=1}^{30} (|\Delta V_i| - \overline{\Delta V})^2}$$

- 5) Procedure 2), 3) and 4) are repeated 10 times to get 10 sigma values. 10 sigma values are averaged.

$$\overline{\sigma} = \frac{1}{10} \sum_{j=1}^{10} \sigma_j$$

- 6)  $\overline{\sigma}$  value calculated using the above procedure is observed  $\sqrt{2}$  times larger than that measured relative to the ground level. So we specify the random noise as follows.

$$\text{Random noise} = \frac{1}{\sqrt{2}} \overline{\sigma}$$

**CAUTION****1. Window Glass**

The dust and stain on the glass window of the package degrade optical performance of CCD sensor.

Keep the glass window clean by saturating a cotton swab in alcohol and lightly wiping the surface, and allow the glass to dry, by blowing with filtered dry N<sub>2</sub>.

Care should be taken to avoid mechanical or thermal shock because the glass window is easily to damage.

**2. Electrostatic Breakdown**

Store in shorting clip or in conductive foam to avoid electrostatic breakdown.

**3. Incident Light**

CCD sensor is sensitive to infrared light.

Note that infrared light component degrades resolution and PRNU of CCD sensor.

**4. Lead Frame Forming**

Since this package is not strong against mechanical stress, you should not reform the lead frame.

We recommend to use a IC-inserter when you assemble to PCB.
