**FUNCTION**

**Read**

Set the  $\overline{CE}$  and  $\overline{OE}$  terminals to the read mode (low level). Low level input to  $\overline{CE}$  and  $\overline{OE}$  and address signals to the address inputs ( $A_0 \sim A_{12}$ ) make the data contents of the designated address location available at the data input/output ( $D_0 \sim D_7$ ). When the  $\overline{CE}$  or  $\overline{OE}$  signal is high, data input/output are in a floating state.

When the  $\overline{CE}$  signal is high, the device is in the standby mode or power-down mode.

In the read mode  $V_{PP}$  must be at  $V_{CC}$  level.

**Programming**

**(Fast programming algorithm)**

First set  $V_{CC}=6V$ ,  $V_{PP}=21V$  and then set an address to first address to be programmed. After applying 1 ms program pulse ( $\overline{PGM}$ ) to the address, verify is performed. If the output data of that address is not verified correctly, apply one more 1 ms program pulse. The programmer continues 1 ms pulse-then-verify routines until the device verify correctly or fifteen of these pulse-then-verify routines have been completed. The programmer also maintains its total number of 1 ms pulses applied to that address in register X. And then applied a program pulse 4 times of register X value long as an overprogram pulse. When the programming procedure above is finished, step to the next address and repeat this procedure till last address to be programmed. (See P.6-9)

**(Conventional programming algorithm)**

The device enters the programming mode when 21V is supplied to the  $V_{PP}$  power supply input and  $\overline{CE}$  is at low level. A location is designated by address signals ( $A_0 \sim A_{12}$ ), and the data to be programmed must be applied at 8-bits in parallel to the data inputs ( $D_0 \sim D_7$ ). A program pulse to the  $\overline{PGM}$  at this state will effect programming. Only one programming pulse is required, but its width must satisfy the condition  $45 \text{ ms} \leq t_{PW} \leq 55 \text{ ms}$ .

**Erase**

Erase is effected by exposure to ultraviolet light with a wavelength of  $2537\text{\AA}$  at an intensity of approximately  $15\text{WS}/\text{cm}^2$ . Sunlight and fluorescent light may contain ultraviolet light sufficient to erase the programmed information. For any operation in the read mode, the transparent lid should be covered with opaque tape.

Note 1: Stresses above those listed may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods affects device reliability.
