

Voltage comparator

NE527

DESCRIPTION

The NE527 is a high-speed analog voltage comparator which, for the first time, mates state-of-the-art Schottky diode technology with the conventional linear process. This allows simultaneous fabrication of high speed TTL gates with a precision linear amplifier on a single monolithic chip. The NE527 is similar in design to the Philips Semiconductors NE529 voltage comparator except that it incorporates an "Emitter-Follower" input stage for extremely low input currents. This opens the door to a whole new range of applications for analog voltage comparators.

FEATURES

- 15ns propagation delay
- Complementary output gates
- TTL or ECL compatible outputs
- Wide common-mode and differential voltage range
- Typical gain of 5000

PIN CONFIGURATIONS

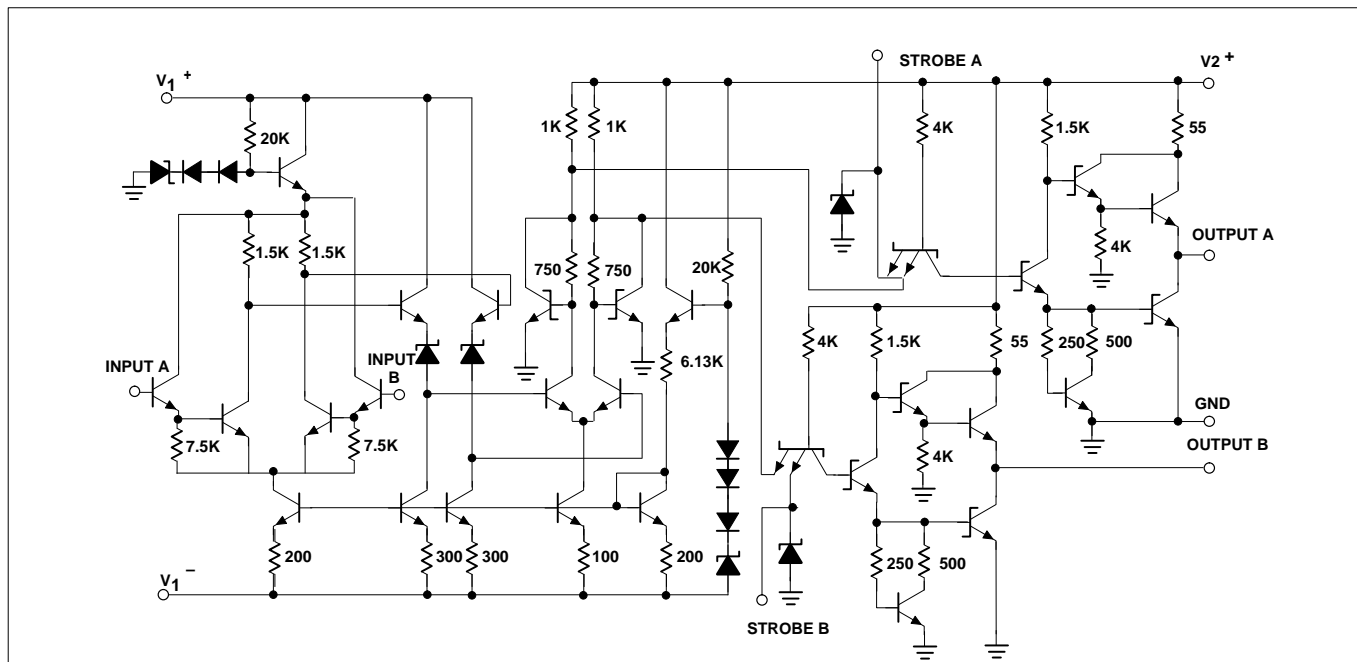

APPLICATIONS

- A/D conversion
- ECL-to-TTL interface
- TTL-to-ECL interface
- Memory sensing
- Optical data coupling

APPLICATIONS

One of the main features of the device is that supply voltages (V_{1+} , V_{1-}) need not be balanced, as in the following diagrams. For proper operation, however, negative supply (V_{1-}) should always be at least 6V more than the ground terminal (Pin 6). Input common-mode

range should be limited to values of 2V less than the supply voltages (V_{1+} and V_{1-}) up to a maximum of $\pm 5V$ as supply voltages are increased. It is also important to note that Output A is in phase with Input A and Output B is in phase with Input B.
