

## DP8480A 10k ECL to TTL Level Translator with Latch

### General Description

This circuit translates ECL input levels to TTL output levels and provides a fall-through latch. The TRI-STATE® outputs are designed to drive standard 50 pF loads. The strobe and chip select inputs operate at ECL levels.

### Features

- 16-pin DIP
- TRI-STATE outputs
- ECL control inputs
- 8 ns typical propagation delay with 50 pF load
- Outputs are TRI-STATE during power up/down for glitch free operation
- 10k ECL input compatible

### Truth Table

D	$\bar{Q}$	STR	$\bar{CS}$
H	L	L	L
L	H	L	L
X	$\bar{Q}$	H	L
X	Hi-Z	X	H

H = high level (most positive)  
 L = low level (most negative)  
 X = don't care

**Note 1:** "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

**Note 2:** Unless otherwise specified, min/max limits apply across the 0°C to 75°C ambient temperature range in still air and across the specified supply variations. All typical values are for T<sub>A</sub> = 25°C and nominal supply. Maximum propagation delays are specified with all outputs switching simultaneously.

**Note 3:** All currents into device pins are shown as positive; all currents out of device pins are shown as negative. All voltages are referenced to ground, unless otherwise specified.

**Note 4:** When DC testing I<sub>AV</sub> or I<sub>OS</sub>, only one output should be tested at a time and the current limited to 120 mA max.

**Note 5:** Unless otherwise specified, all AC measurements are referenced from the 50% level of the ECL input to the 0.8V level on negative transitions or the 2.4V level on positive transitions of the output. ECL input rise and fall times are 2.0 ns ± 0.2 ns from 20% to 80%.

**Note 6:** Caution should be used when latching data while the outputs are switching. TTL outputs generate severe ground noise when switching. This noise can be sufficient to cause the ECL latch to lose data. Board mounting and good supply decoupling are desirable. The worst case conditions are with all outputs switching low simultaneously, the maximum capacitive loading on the outputs and the maximum V<sub>CC</sub> supply voltage applied.

**LIFE SUPPORT POLICY**

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
