- 12-point bar-graph display, linearly corresponding to input DC voltage with accuracy.
- High input impedance facilitates the connection with other circuit-blocks.
- 5mA max. of output current ($V_{CC} \leq 12V$)
- Wide range of supply voltage ($V_{CC} \cong 10$ to $24V$)
- 24-point bar-graph display available by using two HA12010's. (In the case of series-connection, the range of supply voltage is approx. 12 to 24V)

TEST CIRCUIT

Output Voltage vs. Input DC Voltage

Fluorescent Display Tube under 2V of Input Voltage

Fluorescent Display Tube under 1V of Input Voltage

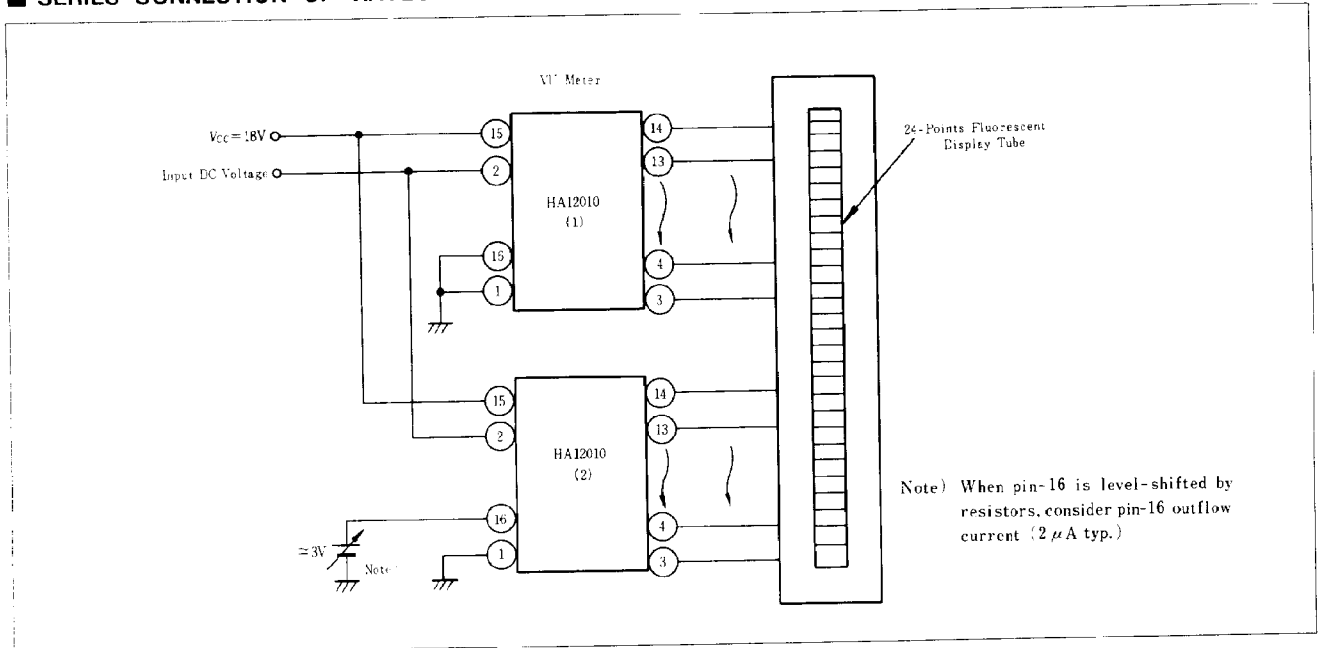

HA12010 contains twelve voltage comparators as the diagram shows. Internal standard voltage which corresponds to each step is supplied to each comparator. When input DC voltage is higher than internal standard voltage, fluorescent display tube

will operate with high level output of fluorescent display tube driver connected to voltage comparator output. For instance, fig. shows 'Output Voltage vs. Input DC Voltage'.
