		Output Port Expansion IC for VTR Applications

Advanced Information

OVERVIEW

The LC7802 is an output port expansion IC that incorporates a 10-bit serial-to-parallel converter, controlled by an external microcontroller, making it ideal for video tape recorder (VTR) applications.

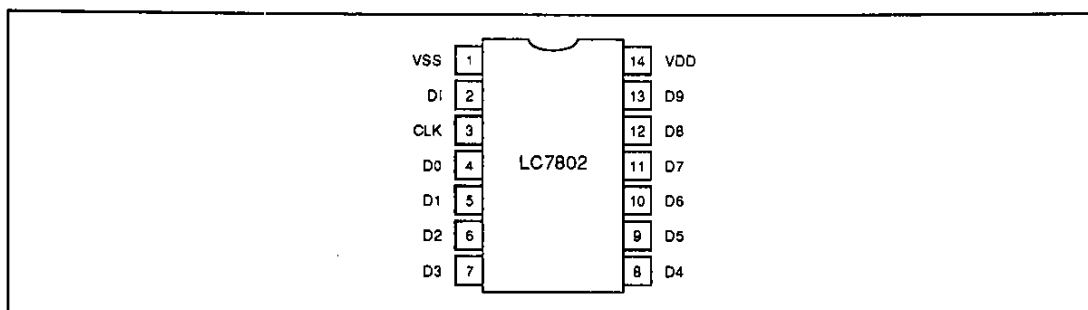

The LC7802 features tristate outputs and an automatically generated latch signal. It also features reset initialization at power-ON to initialize the outputs in the high-impedance state.

The LC7802 operates from a 5 V supply and is available in 14-pin DIPs.

FEATURES

- 10-bit serial-to-parallel converter
- Tristate outputs
- Reset initialization at power-ON
- Latch signal generated automatically
- 5 V supply
- 14-pin DIP

FUNCTIONAL DESCRIPTION

System Timing

At power-ON, a reset initialization occurs to ensure that the outputs are in the high-impedance state before the first latch signal.

Data is shifted into the shift register on the rising edge of the clock, CLK. The shift register contents are latched on the falling edge of CLK when DI is HIGH. The system timing is shown in figure 1.
