SECAM-Format VCR Chroma Signal-Processing Circuit

Overview

The LA7337 is an IC that implements SECAM-format VCR signal processing in a single chip. It incorporates band-pass filters and a SECAM discrimination circuit on chip and features automatic adjustment of the bell filter for a reduced number of external components and adjustment-free circuit operation.

Features

- All required filters, except for the bell filter, incorporated on chip.
- Automatic adjustment of the bell filter f_0 parameter
- Built-in SECAM discrimination circuit

Functions

- 4.3-MHz and 1.1-MHz band-pass filters, limiter, AGC (in playback mode)
- Divide-by-four circuit, 4× frequency multiplier circuit, 2.2-MHz band-pass filter
- Bell filter f_0 automatic adjustment circuit, SECAM discrimination circuit
- Sync gate

Specifications

Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{CC \text{ max}}$		7	V
Allowable power dissipation	$P_d \text{ max}$	$T_a \leq 70^\circ\text{C}$	600	mW

Standard Input Signal Levels

REC-IN (pin 15)	The 200 mVp-p ID component
PB-IN (pin 13)	50 mVp-p

Internal filter group delay times (reference values)

1.1 MHz BPF	460 ns (PB) 430 ns (REC)
2.2 MHz BPF	180 ns
4.3 MHz BPF A	230 ns
4.3 MHz BPF B	170 ns

[Record/playback mode settings]

Pin 16 = low → record mode

Pin 16 = high → playback mode

[Bell filter offset adjustment]

Increasing the pin 6 voltage increases the 1.1-MHz bell filter center frequency (f_0).

Increasing the pin 5 voltage increases the 4.3-MHz bell filter center frequency (f_0).

[Test mode settings]

The IC enters test mode if pin 6 is set to 5 V. The pin 5, 11, 17, and 26 outputs behave as follows in this mode.

Pin 5: The 4.43-MHz VCO output appears (However, note that a load of about 1 k Ω is required between this pin and V_{CC} .)

Pin 11: The 1.1-MHz band-pass filter output appears.

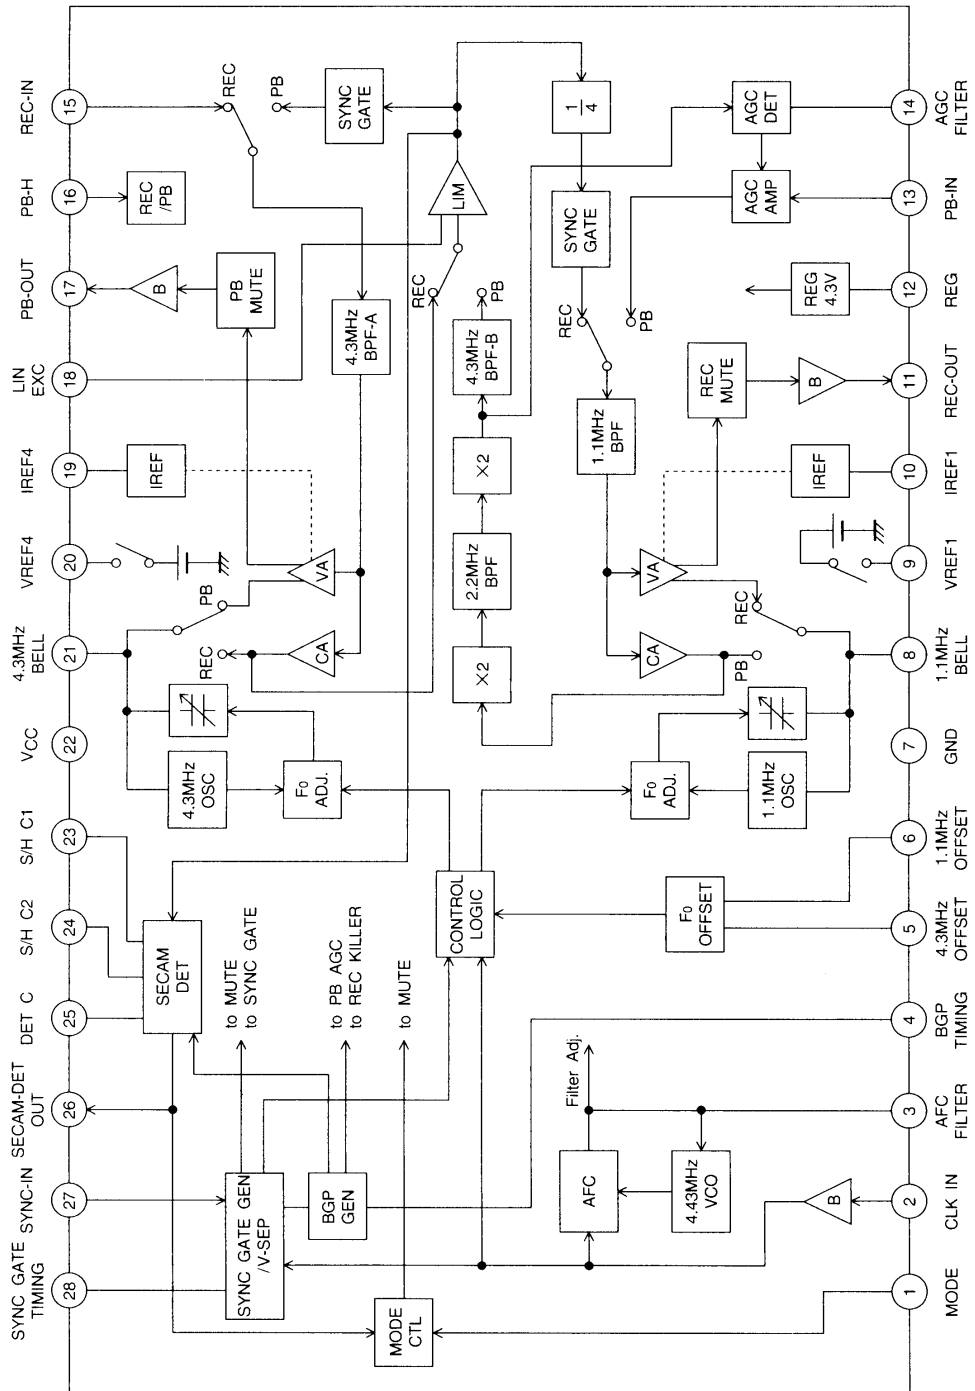

Pin 17: The 4.3-MHz band-pass filter output appears.

Pin 26: The BGP (used for SECAM discrimination, playback AGC, and record killer) can be monitored.

[Muting control table]

Voltage applied to pin 1	Output signal mode (pins 17 and 11)
4 V or higher	Forced SECAM
Open	AUTO (Uses the output of the internal discriminator)
1 V or lower	Forced mute mode
