32,768 WORD x 8 BIT CMOS PSEUDO STATIC RAM

T-46-23-14

DESCRIPTION

The TC51832 Family is a 256K bit high-speed CMOS Pseudo-Static RAM organized as 32,768 words by 8 bits. The TC51832 Family utilizes one transistor dynamic memory cell array with CMOS peripheral circuitry to achieve large capacity, high speed accesses, and low power requirements, using a single 5V power supply. The $\overline{OE}/RFSH$ input allows two types of refresh operations: Auto Refresh and Self Refresh. The TC51832 Family has a static RAM-like read/write functionality, which allows easy interfacing to a microprocessor. The TC51832 Family is pin-compatible with the 256K bit static RAM. The TC51832P is offered in a standard 28 pin 0.6 inch and 0.3 inch width plastic DIP. The TC51832F is offered in a standard 28 pin 0.450 inch width small out-line plastic flat package.

FEATURES

- Organization: 256K bit(32,768 word x 8 bit)
- Fast Access Time and Low Power Dissipation

- Self refresh uses an internal timer.
- All inputs and outputs: TTL compatible
- 256 refresh cycle/4ms
- Pin Compatible: 256K SRAM TC55257
- Logic Compatible: SRAM R/W Pin
- 28 pin Standard Plastic PKG
 - P/PL : 600 mil DIP
 - SP/SPL: 300 mil DIP
 - F/FL : 450 mil SOP

	TC51832P Family		
	-85	-10	-12
t_{CEA} \overline{CE} Access Time	85ns	100ns	120ns
t_{OEA} \overline{OE} Access Time	35ns	40ns	50ns
t_{RC} Cycle Time	135ns	160ns	190ns
P_D -Operating- Max.	303mW	248mW	220mW
Self Refresh Current	1mA/100 μ A (-L)		

- Single Power Supply: 5V \pm 10%
- Auto refresh uses an internal counter.

PIN CONNECTION

PIN NAMES

A0 ~ A14	Address Inputs
R/W	Read/Write Control Input
$\overline{OE}/RFSH$	Output Enable/Refresh Input
\overline{CE}	Chip Enable Input
I/O1 ~ I/O8	Data Inputs/Outputs
VDD	Power (+5V)
GND	Ground

CAPACITANCE (V_{DD}=5V, f=1MHz, Ta=25°C)

SYMBOL	PARAMETER	MIN.	MAX.	UNITS
C _{I1}	Input Capacitance (A0 ~ A14)	-	5	pF
C _{I2}	Input Capacitance ($\overline{\text{CE}}$, $\overline{\text{OE}}$ / $\overline{\text{RFSH}}$, R/W)	-	7	pF
C _{IO}	Input/Output Capacitance (I/O1 ~ I/O8)	-	7	pF

NOTE) This parameter is periodically sampled and is not 100% tested.

NOTES:

- 1) Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.
- 2) All voltages are referenced to GND.
- 3) IDDO depends on cycle rate.
- 4) IDDO depends on output loading. Specified values are obtained with the output open.
- 5) An initial pause of 1ms with high \overline{CE} and high $\overline{OE}/\overline{RFSH}$ are required after power-up, before proper device operation is achieved.
- 6) AC measurements assume $t_T=5ns$.
- 7) $V_{IH}(min.)$ and $V_{IL}(max.)$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
- 8) Measured with a load equivalent to 2 TTL loads and 100pF.
- 9) The $\overline{OE}/\overline{RFSH}$ input operates as the output enable input (\overline{OE}) and refresh control input (\overline{RFSH}) under the condition of that $\overline{CE}=V_{IL}$ and $\overline{CE}=V_{IH}$, respectively.
- 10) t_{CHZ} , t_{OHZ} , t_{WHZ} define the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
- 11) In write cycles, the input data is latched at the earlier of R/W or \overline{CE} rising edge. Therefore the input data must be valid during set-up time (t_{DSW} , t_{DSC}) and hold time (t_{DHW} , t_{DHC}).
- 12) All address inputs are latched at the falling edge of \overline{CE} . Therefore all the address inputs must be valid during t_{ASC} and t_{AHC} .
- 13) Two refresh operation - auto refresh and self refresh are defined by the $\overline{OE}/\overline{RFSH}$ pulse width under the condition of $\overline{CE}=V_{IH}$.

Auto refresh: $\overline{OE}/\overline{RFSH}$ pulse width $\leq t_{FAP}$ (max.)
Self refresh: $\overline{OE}/\overline{RFSH}$ pulse width $\geq t_{FAS}$ (min.)

The following timing parameter must be kept for proper device operation after refresh

Auto refresh: t_{FCE}
Self refresh: t_{FRS}

REFRESH COUNTER TEST CYCLE (READ WRITE)

REFRESH COUNTER TEST

The internal refresh operation of TC51832P family can be tested by REFRESH COUNTER TEST. This cycle performs READ/WRITE operation taking the internal counter address as row address and fixed zero as column address.

The test procedure is as follows.

- ① Write "0" into all the memory cells at normal write mode.
- ② Read "0" out and write "1" in each cell by performing REFRESH COUNTER TEST.
Repeat this operation 256 times.
- ③ Check "1" out of 256 bits at normal read mode, which was written at ②.
- ④ Read "1" out and write "0" in each cell by performing REFRESH COUNTER TEST.
Repeat this operation 256 times.
- ⑤ Check "0" out of 256 bits at normal read mode, which was written at ④.
- ⑥ Perform the above ① to ⑤ the complement data.
