APPLICATION EXAMPLE

PRECAUTIONS FOR APPLICATION

When video output is sent through a 75Ω output and 12V supply is used, an external transistor buffer, such as the one shown in the above diagram, should be connected to maintain a balance with the power dissipation of the package.

Should 9V be the sole supply voltage, a direct drive arrangement can be used as in the diagram at right by connecting resistor R_E between the output pin and ground.

Since an emitter-follower output is used in video and sound outputs, when external wiring is long or a capacitive load is connected, a resistor with a value of several tens of ohms should be connected at a position near the output pin.
