8-input multiplexer with 3-state output

HEF4512B MSI

DESCRIPTION

The HEF4512B is an 8-input multiplexer with 8 binary inputs (I_0 to I_7), an enable input (\bar{E}) and an output enable input (\bar{EO}). One of eight binary inputs is selected by select inputs S_0 , S_1 and S_2 , and is routed to the output O . A HIGH on \bar{EO} causes O to assume a high impedance OFF-state, regardless of other input conditions. This allows the output

to interface directly with bus oriented systems (3-state). When the active LOW enable (\bar{E}) is HIGH, it forces the output LOW provided \bar{EO} is LOW. By proper manipulation of the inputs, the device can provide any logic functions of four variables. It cannot be used to multiplex analogue signals.

PINNING

- S_0, S_1, S_2 select inputs
- \bar{EO} output enable (active LOW)
- \bar{E} enable (active LOW)
- I_0 to I_7 multiplexer inputs
- O multiplexer output
