

**INTRODUCTION**

The KA8503 is a telephone low voltage speech network which includes mic amp, transmit amp, side-tone amp, receive amp. It handles the voice signal performing the 2/4 wire interface and changing the gain on both sending and receiving amplifiers to compensate for line attenuation by sensing the line length through the line current. Application dependent parameters such as amplitude of each amp, sidetone level line balance, and frequency response are controlled by external components. Each gain can be controlled by external component exchange. The receiver output driving capability is adjustable.

**FEATURES**

- Adjust Sending and Receiving Attenuation Length
- Mute Function
- Side Tone Balance Network Constitution
- Low Voltage Operating
- AC Impedance Matching
- Uses Inexpensive Components (5 Capacitors & 10 Resistors)
- Uses a minimum of external components

**PIN CONFIGURATION****Fig. 2****PIN DESCRIPTION**

Pin No	Symbol	Description
1	V +	Positive power line and transmit amplifier output.
2	TXO	Transmit amplifier output. The resistor which is connected this pin to V - sets DC resistance of the circuit. The value of resistor is suitable for 47 ~ 100Ω.
3	TXI	Transmit amplifier input. Input impedance is 17KΩ ± 20%
4	V <sub>DD</sub>	DC power supply pin. This pin will be connected to a decoupling capacitor 47μF~ 100 μF.
5	MUTE	Mute active high input.
6	GR	Gain regulation control input. Input impedance is 5.5 KΩ ± 20%.
7, 8, 9	ST1, ST2, ST3	Separate amplifier control inputs.
10	STO	Separate amplifier output.
11	MIC0	Microphone amplifier output.
12, 13	MIC1, MIC2	Microphone amplifier inputs. Input impedance is 1.7 KΩ ± 20%
14	V -	Negative power line.
15	RXI	Receive amplifier input.
16	RXO1	Receive amplifier output.
17, 18	RXO2, RXO3	Receive amplifier output. Output impedance is 3Ω(Typ)
