

## Voltage Regulator Control Circuit for Variable Switching Regulator

April 1994

### Features

- Operates up to 200kHz
- Pins ESD Protected
- Remote ON/OFF
- Slow Start with Reset
- Overcurrent Sensing
- Lower Peak Currents than PWM Regulator
  - Less Prone to Magnetic Saturation

### Description

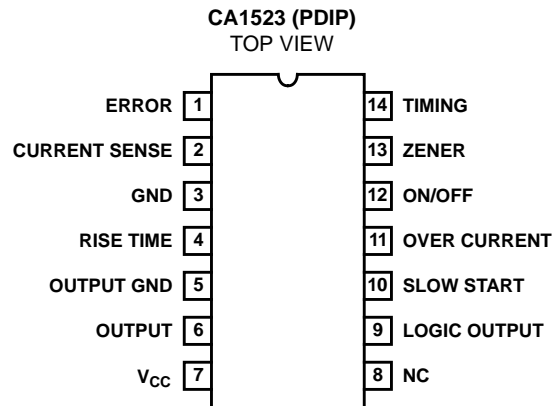

The CA1523 monolithic silicon integrated circuit is a variable interval pulse regulator designed to provide the control circuitry for use in switching regulator circuits. It operates from 11V to 15V.

The regulator provides a single output drive capable of 300mA source/200mA sink. The maximum operating frequency is better than 200kHz. An attractive feature of the CA1523 is that the timing capacitor charge and discharge current is set up externally via a single resistor. The ratio of charge to discharge current is internally set at a maximum of 2 to 1 allowing simultaneous change in output pulse width with increased frequency at higher load. The pulse width variation at higher frequencies effectively compensates for the losses in magnetics and thereby increases the power supply efficiency at higher load end by as much as 20 percent.

## Other Desirable Features

Other desirable features along with various circuit block function explanations are listed below.

- The **Oscillator** is a sawtooth generator whose charge (rise) cycle determines the output pulse width and discharge which is continuously variable from very low to maximum of  $I_{\text{CHARGE}}$ .
- Charge  $I_{\text{CHARGE}} = I_0 - I_{\text{DISCHARGE}}$  giving 2 to 1 pulse-width control
- Discharge  $I_{\text{DISCHARGE}} =$  approximately 0 to  $1/2 I_0$  to frequency control.
- **Pulse Shaping:** Applied to the oscillator output via RS Flip-Flop with parallel inhibit controlled by slow-start over-current sense, supply voltage monitor and ON/OFF functions.
- **Pulse Rise Time:** Modified to meet RFI requirements by external slow-down capacitor.
- **Slow Start with Reset:** Externally programmed against internal 3V reference. Reset is initiated upon Inhibit ensuring soft start at power up and restart.
- **Over Current Sense:** Internal stable thresholds of 1.2V.
- **Supply Voltage Monitors:** Locks out the drive until  $V_{\text{SUPPLY}}$  has reached 8V-9V.
- **ON/OFF:** Activates regulator independent of raw DC.
- **Error Amplifier:** Compares output against a stable 6.8V internal reference and controls the discharge current sink on the timing capacitor.
- **Band-Gap:** Reference voltage (internal) provides temperature compensated 1.2V and 6.8V references.
- **Separate GND:** The power GND is separated from circuit ground for improved noise.
- **ESD Protection:** Pins are protected against ESD.
