

**SANYO****LA7383****NTSC Video Signal Processing LSI for VCRs****Overview**

The LA7383 combines luminance signal processing functions and color signal processing functions for NTSC VCRs on a single chip. Developed as a new-generation LSI for use in VCRs which offer increasingly higher image quality, the LA7383 offers all of the functions needed in order to realize improved picture quality in a dramatically compact 36-pin package, making this device suitable for a wide range of VCRs, from popularly priced models to high-end models.

**Package Dimensions**

unit : mm

**3170-DIP36S****Features**

- Includes all functions required for video signal processing in an NTSC VCR.
- Supports full HQ functions.
  - YNR on chip (standard).
  - CNR on chip (external components can be removed for passthrough operation).
  - Detail enhancer on chip.
  - Higher white clipping level (190%).
- In addition to the above, also provides the following functions for excellent image quality:
  - Edge compensation.
  - Double high-pass noise canceller → permits wide-band noise reduction.
  - Linear phase-type image quality adjustment → ideal image quality adjustment method, with no waveform distortion.
- By adopting the ICCD method, one comb filter (glass) has become unnecessary.
  - Has a single 1H-delay CCD and a comb Y/C separation/YNR chroma crosstalk canceller function on chip.
- Automatic adjustment filter on chip.
  - Y: LPF
  - C: 3.58 MHz BPF, 4.21 MHz BPF, LPF (REC)
- No adjustment required for white and dark clipping levels.
- Extremely few peripheral components (about 60 components, excluding peripheral components for the CCD).
- fsc output can be used as clock for OSD IC.
  - Crystal oscillator for the on-screen display circuit is not required.
- DCC circuit on chip.
  - Suppresses flicker at top of screen and reduces AM noise.
- High-speed AFC circuit.
  - Prevents color alteration and loss at top of screen when dubbing.
- Head switching noise reduction circuit on chip.
- Smallest package in the industry.
- Few components needed.

PB chroma pin 21 output level	V <sub>op-21</sub>	Measure the T21 burst level under the same conditions as for V <sub>op-28</sub>	170	200	230	mVp-p
PB ACC characteristics 1	ACC <sub>p1</sub>	Input the input chroma level at +6 dB under the same conditions as for V <sub>op-28</sub> and measure the T21 burst level, and calculate the ratio with V <sub>op-21</sub>		+0.5	+0.8	dB
PB ACC characteristics 2	ACC <sub>p2</sub>	Input the input chroma level at -6 dB under the same conditions as for V <sub>op-28</sub> and measure the T21 burst level, and calculate the ratio with V <sub>op-21</sub>	-0.5	-0.2		dB
PB killer input level	V <sub>OACK-P</sub>	Lower the input chroma level under the same conditions as for V <sub>op-28</sub> and measure the input burst level at the point where T21 chroma output ceases. (Calculate ratio with standard input of 50 mVp-p)	-55		-40	dB
PB killer chroma output level	V <sub>OACK-P</sub>	Use a spectrum analyzer to measure the T28 chroma output level in the killer state described previously. Calculate ratio with V <sub>op-28</sub> .		-44	-40	dB
PB main converter carrier leak	C <sub>LP</sub>	Monitor T28A with a spectrum analyzer under the same conditions as for V <sub>op-28</sub> and calculate the ratio between the 3.58 MHz component and the 4.21 MHz carrier leak component.		-40	-33	dB
Burst de-emphasis amount	G <sub>BD</sub>	From T14A, input a 629 kHz 50 mVp-p continuous wave; from T3A, input a 50% white signal, and calculate the ratio between the output level during the T21 burst interval and the output level during other intervals	-4.35	-4.6	-4.85	dB
PB XO output level	V <sub>XO-P</sub>	In PB mode, measure the T18 output level with an FET probe	480	610	750	mVp-p
