

Fibre Channel Transceiver Chip

Technical Data

HDMP-1536A Transceiver HDMP-1546A Transceiver

Features

- ANSI X3.230-1994 Fibre Channel Compatible (FC-0)
- Supports Full Speed (1062.5 MBd) Fibre Channel
- Compatible with “Fibre Channel 10-Bit Interface” Specification
- Low Power Consumption, 630 mW
- Transmitter and Receiver Functions Incorporated onto a Single IC
- Auto Frequency Lock
- Small Package Profile
HDMP-1536A, 10x10 mm QFP
HDMP-1546A, 14x14 mm QFP
- 10-Bit Wide Parallel TTL Compatible I/Os
- Single +3.3 V Power Supply
- 5 Volt Tolerant I/Os
- 2 kV ESD Protection on All Pins

Applications

- 1062.5 MBd Fibre Channel Interface
- FC Interface for Disk Drives and Arrays
- Mass Storage System I/O Channel
- Work Station/Server I/O Channel

- High Speed Proprietary Interface
- High Speed Backplane Interface

Description

The HDMP-1536/46A transceiver is a single silicon bipolar integrated circuit packaged in a plastic QFP package. It provides a low-cost, low-power physical layer solution for 1062.5 MBd Fibre Channel or proprietary link interfaces. It provides complete FC-0 functionality for copper transmission, incorporating both the Fibre Channel FC-0 transmit and receive functions into a single device.

This chip is used to build a high-speed interface (as shown in Figure 1) while minimizing board space, power, and cost. It is compatible with both the ANSI X3.230-1994/AM 1 - 1996 document and the “Fibre Channel 10-bit Interface” specification.

The transmitter section accepts 10-bit wide parallel TTL data and multiplexes this data into a high-speed serial data stream. The parallel data is expected to be 8B/10B encoded data, or equivalent. This parallel data is latched into the input register of

the transmitter section on the rising edge of the 106.25 MHz reference clock (used as the transmit byte clock).

The transmitter section's PLL locks to this user supplied 106.25 MHz byte clock. This clock is then multiplied by 10, to generate the 1062.5 MHz serial signal clock used to generate the high-speed output. The high-speed outputs are capable of interfacing directly to copper cables for electrical transmission or to a separate fiber-optic module for optical transmission.

The receiver section accepts a serial electrical data stream at 1062.5 MBd and recovers the original 10-bit wide parallel data. The receiver PLL locks onto the incoming serial signal and

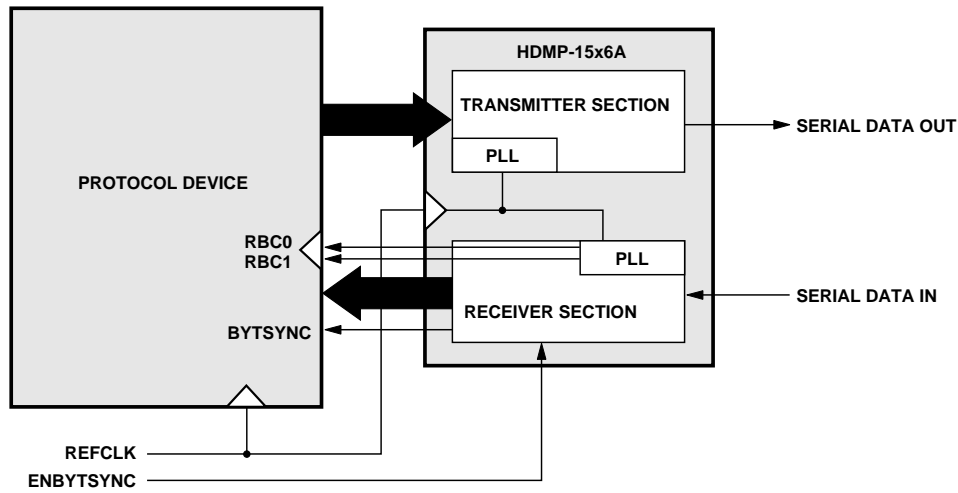

Figure 1. Typical Application Using the HDMP-15x6A.

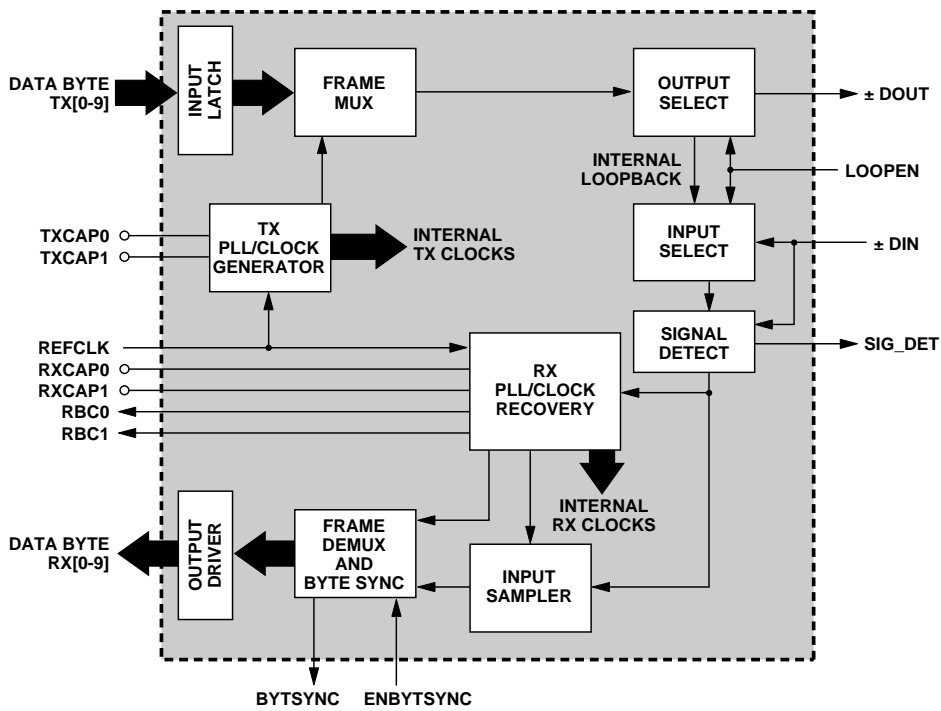

Figure 2. HDMP-15x6A Transceiver Block Diagram.

recovers the high-speed serial clock and data. The serial data is converted back into 10-bit parallel data, recognizing the 8B/10B comma character to establish byte alignment.

The recovered parallel data is presented to the user at TTL compatible outputs. The receiver section also recovers two 53.125 MHz receiver byte clocks that are 180 degrees out of phase with each other. The parallel data is properly aligned with the rising edge of alternating clocks.

For test purposes, the transceiver provides for on-chip local loop-back functionality controlled through an external input pin. Additionally, the byte synchronization feature may be disabled. This may be useful in proprietary applications which use alternative methods to align the parallel data.

HDMP-1536/46A Block Diagram

The HDMP-1536/46A was designed to transmit and receive 10-bit wide parallel data over a single high-speed line, as specified for the FC-0 layer of the Fibre Channel standard. The parallel data applied to the transmitter is expected to be encoded per the Fibre Channel specification, which uses an 8B/10B encoding scheme with special reserve characters for link management purposes. In order to accomplish this task, the HDMP-1536/46A incorporates the following:

- TTL Parallel I/Os
- High Speed Phase Lock Loops
- High Speed Serial Clock and Data Recovery Circuitry

- Parallel to Serial Converter
- Comma Character Recognition Circuitry
- Byte Alignment Circuitry
- Serial to Parallel Converter

INPUT LATCH

The transmitter accepts 10-bit wide TTL parallel data at inputs TX[0..9]. The user-provided reference clock signal, REFCLK, is also used as the transmit byte clock. The TX[0..9] and REFCLK signals must be properly aligned, as shown in Figure 3.

TX PLL/CLOCK GENERATOR

The transmitter Phase Lock Loop and Clock Generator (TX PLL/CLOCK GENERATOR) block is responsible for generating all internal clocks needed by the transmitter section to perform its functions. These clocks are based on the supplied reference byte clock (REFCLK). REFCLK is used as both the frequency reference clock for the PLL and the transmit byte clock for the incoming data latches. It is expected to be 106.25 MHz and properly aligned to the incoming parallel data (see Figure 3). This clock is multiplied by 10 to generate the 1062.5 MHz clock necessary for the high speed serial outputs.

FRAME MUX

The FRAME MUX accepts the 10-bit wide parallel data from the INPUT LATCH. Using internally generated high speed clocks, this parallel data is multiplexed into the 1062.5 MBd serial data stream. The data bits are transmitted sequentially, from the least significant bit (TX[0]) to the most significant bit (TX[9]).

OUTPUT SELECT

The OUTPUT SELECT block provides for an optional internal loopback of the high speed serial signal, for testing purposes.

In normal operation, LOOPEN is set low and the serial data stream is placed at \pm DOUT. When wrap-mode is activated by setting LOOPEN high, the \pm DOUT pins are held static at logic 1 and the serial output signal is internally wrapped to the INPUT SELECT box of the receiver section.

INPUT SELECT

The INPUT SELECT block determines whether the signal at \pm DIN or the internal loop-back serial signal is used. In normal operation, LOOPEN is set low and the serial data is accepted at \pm DIN. When LOOPEN is set high, the high-speed serial signal is internally looped-back from the transmitter section to the receiver section. This feature allows for loop-back testing exclusive of the transmission medium.

RX PLL/CLOCK RECOVERY

The RX PLL/CLOCK RECOVERY block is responsible for frequency and phase locking onto the incoming serial data stream and recovering the bit and byte clocks. An automatic locking feature allows the Rx PLL to lock onto the input data stream without external PLL training controls. It does this by continually frequency locking onto the 106.25 MHz clock, and then phase locking onto the input data stream. An internal signal detection circuit monitors the presence of the input, and invokes the phase detection as the data stream appears. Once bit locked, the receiver generates the high speed

sampling clock at 1062.5 MHz for the input sampler, and recovers the two 53.125 MHz receiver byte clocks (RBC1/RBC0). These clocks are 180 degrees out of phase with each other, and are alternately used to clock the 10-bit parallel output data.

INPUT SAMPLER

The INPUT SAMPLER is responsible for converting the serial input signal into a re-timed serial bit stream. In order to accomplish this, it uses the high speed serial clock recovered from the RX PLL/CLOCK RECOVERY block. This serial bit stream is sent to the FRAME DEMUX and BYTE SYNC block.

FRAME DEMUX AND BYTE SYNC

The FRAME DEMUX AND BYTE SYNC block is responsible for restoring the 10-bit parallel data from the high speed serial bit

stream. This block is also responsible for recognizing the comma character (or a K28.5 character) of positive disparity (0011111xxx). When recognized, the FRAME DEMUX AND BYTE SYNC block works with the RX PLL/CLOCK RECOVERY block to properly align the receive byte clocks to the parallel data. When a comma character is detected and realignment of the receiver byte clocks (RBC1/RBC0) is necessary, these clocks are stretched, not slivered, to the next possible correct alignment position. These clocks will be fully aligned by the start of the second 4-byte ordered set. The second comma character received shall be aligned with the rising edge of RBC1. As per the 8B/10B encoding scheme, comma characters should not be transmitted in consecutive bytes to allow the receiver byte clocks to maintain their proper recovered frequencies.

OUTPUT DRIVERS

The OUTPUT DRIVERS present the 10-bit parallel recovered data byte properly aligned to the receiver byte clocks (RBC1/RBC0), as shown in Figure 5. These output data buffers provide TTL compatible signals.

SIGNAL DETECT

The SIGNAL DETECT block examines the differential amplitude of the inputs \pm DIN. When this input signal is too small, it outputs a logic 0 at SIG_DET (refer to SIG_DET pin definition for detection thresholds), and at the same time, forces the parallel output RX[0]..RX[9] to all logic one (1111111111). The main purpose of this circuit is to prevent the generation of random data when the serial input lines are disconnected. When the signal at \pm DIN is of a valid amplitude, SIG_DET is set to logic 1, and the output of the INPUT SELECT block is passed through.

HDMP-1536/46A (Transmitter Section)

Timing Characteristics

$T_A^{[1]}$ = 0°C to +70°C, V_{CC} = 3.15 V to 3.45 V

Symbol	Parameter	Units	Min.	Typ.	Max.
t_{setup}	Setup Time	nsec	2		
t_{hold}	Hold Time	nsec	1.5		
$t_{\text{txlat}}^{[2]}$	Transmitter Latency	nsec		3.5	
		bits		4.4	

Notes:

1. Device tested and characterized under T_A conditions specified, with T_C monitored at approximately 20° higher than T_A .
2. The transmitter latency, as shown in Figure 4, is defined as the time between the latching in of the parallel data word (as triggered by the rising edge of the transmit byte clock, REFCLK) and the transmission of the first serial bit of that parallel word (defined by the rising edge of the first bit transmitted).

Figure 3. Transmitter Section Timing.

Figure 4. Transmitter Latency.

HDMP-1536/46A (Receiver Section)

Timing Characteristics

$T_A^{[1]} = 0^\circ\text{C to } +70^\circ\text{C}$, $V_{CC} = 3.15\text{ V to } 3.45\text{ V}$

Symbol	Parameter	Units	Min.	Typ.	Max.
b_sync[2,3]	Bit Sync Time	bits			2500
$t_{\text{valid_before}}$	Time Data Valid Before Rising Edge of RBC	nsec	3		
$t_{\text{valid_after}}$	Time Data Valid After Rising Edge of RBC	nsec	1.5		
t_{duty}	RBC Duty Cycle	%	40		60
$t_{A-B}^{[4]}$	Rising Edge Time Difference between RBC0 and RBC1.	nsec	8.9	9.4	9.9
$t_{\text{rxlat}}^{[5]}$	Receiver Latency	nsec		24.5	
		bits		26	

Notes:

1. Device tested and characterized under T_A conditions specified, with T_C monitored at approximately 20° higher than T_A .
2. This is the recovery time for input phase jumps, per the FC-PH specification Ref 4.1, Sec 5.3.
3. Tested using $C_{PLL} = 0.1\ \mu\text{F}$.
4. The RBC clock skew is calculated as $t_{A-B(\text{max})} - t_{A-B(\text{min})}$.
5. The receiver latency, as shown in Figure 6, is defined as the time between receiving the first serial bit of a parallel data word (defined as the first edge of the first serial bit) and the clocking out of that parallel word (defined by the rising edge of the receive byte clock, either RBC1 or RBC0).

Thermal and Power Temperature Characteristics,

$T_A^{[1]} = 0^\circ\text{C}$ to $+70^\circ\text{C}$, $V_{CC} = 3.15\text{ V}$ to 3.45 V

Symbol	Parameter	Units	Typ.	Max.
$P_{D,TRX}^{[2,3]}$	Transceiver Power Dissipation, Outputs Open, Parallel Data has 5 Ones and 5 Zeroes	mW	630	850
$P_{D,TRX}^{[2,3,4]}$	Transceiver Power Dissipation, Outputs Connected per Recommended Bias Terminations with Idle Pattern	mW	675	900
$\Theta_{jc}^{[5]}$	Thermal Resistance, Junction to Case HDMP-1536A HDMP-1546A	$^\circ\text{C}/\text{Watt}$	11 8	

Notes:

- Device tested and characterized under T_A conditions specified, with T_C monitored at approximately 20° higher than T_A .
- P_D is obtained by multiplying the max V_{CC} by the max I_{CC} and subtracting the power dissipated outside the chip at the high speed bias resistors.
- Typical value specified with $V_{CC} = 3.3$ volts, maximum value specified with $V_{CC} = 3.45$ volts.
- Specified with high speed outputs biased with $150\ \Omega$ resistors and receiver TTL outputs driving $10\ \text{pF}$ loads.
- Based on independent package testing by Agilent Technologies. Θ_{ja} for these devices is $56^\circ\text{C}/\text{Watt}$ for the HDMP-1536A and $51^\circ\text{C}/\text{Watt}$ for the HDMP-1546A. Θ_{ja} is measured on a standard 3×3 " FR4 PCB in a still air environment. To determine the actual junction temperature in a given application, use the following: $T_j = T_C + (\Theta_{jc} \times P_D)$, where T_C is the case temperature measured on the top center of the package and P_D is the power being dissipated.

I/O Type Definitions

I/O Type	Definition
I-TTL	Input TTL, Floats High When Left Open
O-TTL	Output TTL
HS_OUT	High Speed Output, ECL Compatible
HS_IN	High Speed Input
C	External Circuit Node
S	Power Supply or Ground

Pin Input Capacitance

Symbol	Parameter	Units	Typ.	Max.
C_{INPUT}	Input Capacitance on TTL Input Pins	pF	1.6	

Figure 9. O-TTL and I-TTL Simplified Circuit Schematic.

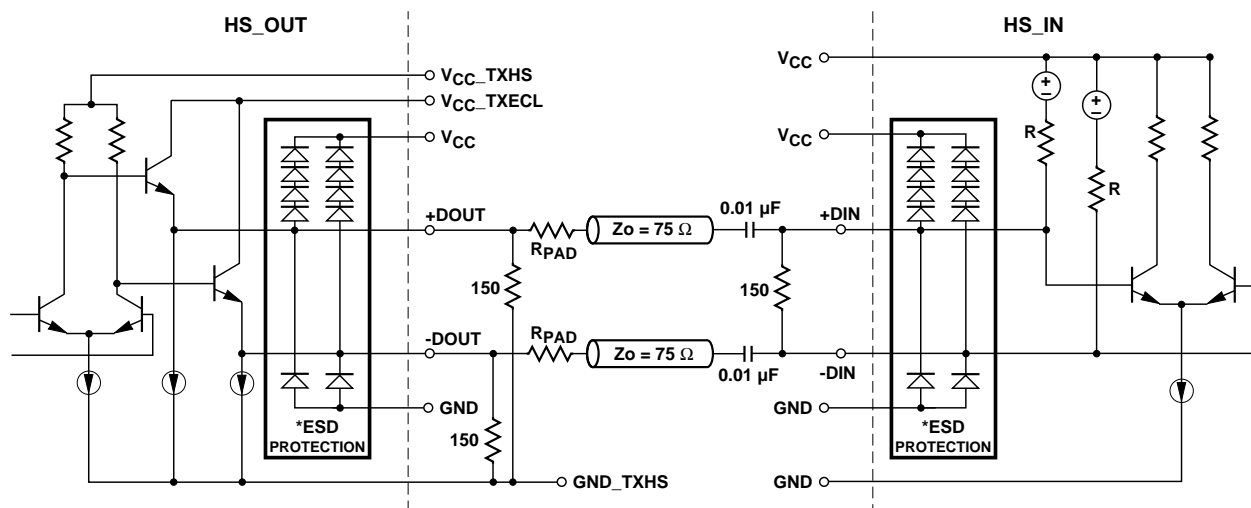

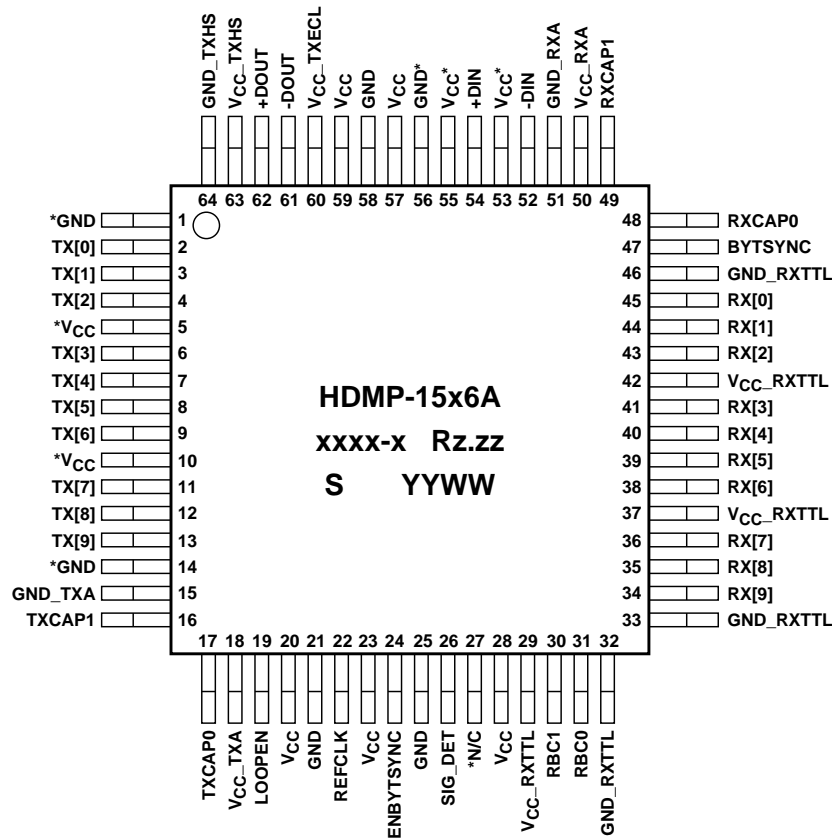

Figure 10. HS_OUT and HS_IN Simplified Circuit Schematic.

Notes:

1. HS_IN inputs should never be connected to ground as permanent damage to the device may result.
2. The optional series padding resistors (R_{pad}) help dampen load reflections. Typical R_{pad} values for mismatched loads range between 25-75 Ω .

Figure 11. HDMP-1536/46A (TRx) Package Layout and Marking, Top View.

*N/C: This pin is connected to an isolated pad and has no functionality. It can be left open, however, TTL levels can also be applied to this pin.

*V_{CC}: This pin is bonded to an isolated pad and has no functionality. However, it is recommended that this pin be connected to V_{CC} in order to conform with the X3T11 “10-bit specification,” and to help dissipate heat.

*GND: This pin is bonded to an isolated pad and has no functionality. However, it is recommended that this pin be connected to GND in order to conform with the X3T11 “10-bit specification,” and to help dissipate heat.

TRx I/O Definition

Name	Pin	Type	Signal
BYTSYNC	47	O-TTL	Byte Sync Output: An active high output. Used to indicate detection of a comma character (0011111XXX). It is only active when ENBYTSYNC is enabled.
-DIN +DIN	52 54	HS_IN	Serial Data Inputs: High-speed inputs. Serial data is accepted from the \pm DIN inputs when LOOPEN is low.
-DOUT +DOUT	61 62	HS_OUT	Serial Data Outputs: High-speed outputs. These lines are active when LOOPEN is set low. When LOOPEN is set high, these outputs are held static at logic level 1.
ENBYTSYNC	24	I-TTL	Enable Byte Sync Input: When high, turns on the internal byte sync function to allow clock synchronization to a comma character (0011111XXX). When the line is low, the function is disabled and will not reset registers and clocks, or strobe the BYTSYNC line.
GND	21 25 58	S	Logic Ground: Normally 0 volts. This ground is used for internal PECL logic. It should be isolated from the noisy TTL ground as well as possible.
*GND	1 14 56		This pin is bonded to an isolated pad and has no functionality. However, it is recommended that this pin be connected to GND in order to conform with the X3T11 "10-bit specification," and to help dissipate heat.
GND_RXA	51	S	Analog Ground: Normally 0 volts. Used to provide a clean ground plane for the receiver PLL and high-speed analog cells.
GND_RXTTL	32 33 46	S	TTL Receiver Ground: Normally 0 volts. Used for the TTL output cells of the receiver section.
GND_TXA	15	S	Analog Ground: Normally 0 volts. Used to provide a clean ground plane for the PLL and high-speed analog cells.
GND_TXHS	64	S	Ground: Normally 0 volts.
LOOPEN	19	I-TTL	Loopback Enable Input: When set high, the high-speed serial signal is internally wrapped from the transmitter's serial loopback outputs back to the receiver's loopback inputs. Also, when in loopback mode, the \pm DOUT outputs are held static at logic level 1. When set low, \pm DOUT outputs and \pm DIN inputs are active.
*N/C	27		This pin is connected to an isolated pad and has no functionality. It can be left open, however, TTL levels can also be applied to this pin.
RBC1 RBC0	30 31	O-TTL	Receiver Byte Clocks: The receiver section recovers two 53.125 MHz receive byte clocks. These two clocks are 180 degrees out of phase. The receiver parallel data outputs are alternatively clocked on the rising edge of these clocks. The rising edge of RBC1 aligns with the output of the comma character (for byte alignment) when detected.
REFCLK	22	I-TTL	Reference Clock and Transmit Byte Clock: A 106.25 MHz clock supplied by the host system. The transmitter section accepts this signal as the frequency reference clock. It is multiplied by 10 to generate the serial bit clock and other internal clocks. The transmit side also uses this clock as the transmit byte clock for the incoming parallel data TX[0]..TX[9]. It also serves as the reference clock for the receive portion of the transceiver.

TRx I/O Definition (cont'd.)

Name	Pin	Type	Signal
RX[0] RX[1] RX[2] RX[3] RX[4] RX[5] RX[6] RX[7] RX[8] RX[9]	45 44 43 41 40 39 38 36 35 34	O-TTL	Data Outputs: One 10 bit data byte. RX[0] is the first bit received. RX[9] is the least significant bit.
RXCAP0 RXCAP1	48 49	C	Loop Filter Capacitor: A loop filter capacitor for the internal PLL must be connected across the RXCAP0 and RXCAP1 pins. (typical value = 0.1 μ F).
SIG_DET	26	O-TTL	Signal Detect: Indicates a loss of signal on the high-speed differential inputs, \pm DIN, as in the case where the transmission cable becomes disconnected. If \pm DIN \geq 200 mV peak-to-peak, SIG_DET = logic 1. If \pm DIN \leq 200 mV and \pm DIN $>$ 50 mV, SIG_DET = undefined. If \pm DIN \leq 50 mV, SIG_DET = logic 0, RX[0:9] = 1111111111.
TX[0] TX[1] TX[2] TX[3] TX[4] TX[5] TX[6] TX[7] TX[8] TX[9]	2 3 4 6 7 8 9 11 12 13	I-TTL	Data Inputs: One, 10 bit, pre-encoded data byte. TX[0] is the first bit transmitted. TX[9] is the least significant bit.
TXCAP1 TXCAP0	16 17	C	Loop Filter Capacitor: A loop filter capacitor must be connected across the TXCAP1 and TXCAP0 pins (typical value = 0.1 μ F).
V _{CC}	20,23 28 57,59	S	Logic Power Supply: Normally 3.3 volts. Used for internal receiver PECL logic. It should be isolated from the noisy TTL supply as well as possible.
V _{CC_RXA}	50	S	Analog Power Supply: Normally 3.3 volts. Used to provide a clean supply line for the PLL and high-speed analog cells.
*V _{CC}	5 10 53,55	S	This pin is bonded to an isolated pad and has no functionality. However, it is recommended that this pin be connected to V _{CC} in order to conform with the X3T11 "10-bit specification," and to help dissipate heat.
V _{CC_RXTTL}	29 37 42	S	TTL Power Supply: Normally 3.3 volts. Used for all TTL receiver output buffer cells.
V _{CC_TXA}	18	S	Analog Power Supply: Normally 3.3 volts. Used to provide a clean supply line for the PLL and high-speed analog cells.
V _{CC_TXECL}	60	S	High-Speed ECL Supply: Normally 3.3 volts. Used only for the last stage of the high-speed transmitter output cell (HS_OUT) as shown in Figure 10. Due to high current transitions, this V _{CC} should be well bypassed to a ground plane.
V _{CC_TXHS}	63	S	High-Speed Supply: Normally 3.3 volts. Used by the transmitter side for the high-speed circuitry. Noise on this line should be minimized for best operation.

* IT IS RECOMMENDED THAT THESE PINS BE CONNECTED TO THE APPROPRIATE SUPPLY LINE, EITHER V_{CC} OR GND, EVEN THOUGH THE PIN IS BONDED TO AN ISOLATED PAD. REFER TO THE I/O DEFINITIONS SECTION FOR THESE PINS FOR MORE DETAILS.

** SUPPLY VOLTAGE INTO V_{CC_RXA} AND V_{CC_TXA} SHOULD BE FROM A LOW NOISE SOURCE. ALL BYPASS CAPACITORS AND PLL FILTER CAPACITORS ARE 0.1 μF .

Transceiver Power Supply Bypass and Loop Filter Capacitors

Bypass capacitors should be used and placed as close as possible to the appropriate power supply pins of the HDMP-1536/46A as shown on the schematic of Figure 12. All bypass capacitor values are 0.1 μF . The V_{CC_RXA} and V_{CC_TXA} pins are the analog power supply pins for the PLL sections. The voltage into these pins should be clean with minimum noise. The PLL loop filter capacitor values and their pin locations are also shown on Figure 12. Notice that only two capacitors are required: C_{PLL} for the transmitter and C_{PLL} for the receiver. Nominal capacitance is 0.1 μF . The voltage across the capacitors is on the order of 1 volt maximum, so the capacitor can be a low voltage type and physically small. The PLL capacitors are placed physically close to the appropriate pins on the HDMP-1536/46A. Keeping the lines short will prevent them from picking up stray noise from surrounding lines or components.

Figure 12. Power Supply Bypass.

Start-up Procedure:

The transceiver start-up procedure(s) use the following conditions: $V_{CC} = +3.3 \text{ V} \pm 5\%$ and $\text{REFCLK} = 106.25 \text{ MHz} \pm 100 \text{ ppm}$. After the above

conditions have been met, apply valid data using a balanced code such as 8B/10B. Frequency lock occurs within 500 μs . After frequency lock, phase lock occurs within 2500 bit times.

CAUTION: As with all semiconductor ICs, it is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by electrostatic discharge (ESD).

Package Information

Item	Details
Package Material	Plastic
Lead Finish Material	85% Tin, 15% Lead
Lead Finish Thickness	300-800 μm
Lead Coplanarity	HDMP-1536A: 0.08 mm max. HDMP-1546A: 0.10 mm max.

Mechanical Dimensions

Part Number	A1	A2	B1	B2	B3	B4	B5	C1	C2	C3
HDMP-1536A	10.00	13.20	0.22	0.50	0.60	0.17	0.25	2.00	0.25 min.	2.45
HDMP-1546A	14.00	17.20	0.35	0.80	0.88	0.17	0.25	2.00	0.25 max.	2.35
Tolerance	± 0.10	± 0.25	± 0.05	Basic	+0.15/ -0.10	max.		+0.10/-0.05		max.

Figure 13. Mechanical Dimensions of HDMP-1536/46A.
