

LP8340

Low Dropout, Low I_Q , 1.0A CMOS Linear Regulator

General Description

The LP8340 low-dropout CMOS linear regulator is available in 5V, 3.3V, 2.5V, 1.8V and adjustable output versions. Packaged in the 6ld LLP package and 3ld DPAK. The LP8340 can deliver up to 1.0A output current.

Typical dropout voltage is 420mV at 1.0A for the 5.0V version, 540mV at 1.0A for the 3.3V version, 670mV at 1.0A for the 2.5V version and 680mV at 800mA for the 1.8V version.

The LP8340 includes a zener trimmed bandgap voltage reference, foldback current limiting and thermal overload limiting.

The LP8340 features a PMOS output transistor which unlike PNP type low dropout regulators requires no base drive current. This allows the device ground current to remain less than 50 μ A over operating temperature, supply voltage and irrespective of the load current.

Features

- $\pm 1.5\%$ Typical V_{OUT} tolerance
- 420mV Typical Dropout @ 1.0A ($V_O = 5V$)
- Wide Operating Range 2.7V to 10V
- Internal 1.0A PMOS Output Transistor
- 19 μ A Typical Quiescent Current
- Thermal Overload Limiting
- Foldback Current Limiting
- Zener Trimmed Bandgap Reference
- Space saving LLP package
- Temperature Range
 - LP8340C 0°C to 125°C
 - LP8340I -40°C to 125°C

Applications

- Hard Disk Drives
- Notebook Computers
- Battery Powered Electronics
- Portable Instrumentation

Typical Applications

Note 1: Absolute Maximum ratings indicate limits beyond which damage may occur. Electrical specifications do not apply when operating the device outside of its rated operating conditions.

Note 2: All voltages are with respect to the potential at the ground pin.

Note 3: Maximum Power dissipation for the device is calculated using the following equations:

$$P_D = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

where $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction-to-ambient thermal resistance. The value of the θ_{JA} for the LLP package is specifically dependant on the PCB trace area, trace material, and the number of layers and thermal vias. For improved thermal resistance and power dissipation for the LLP package, refer to Application Note AN-1187.

Note 4: Typical Values represent the most likely parametric norm.

Note 5: All limits are guaranteed by testing or statistical analysis.

Note 6: Human body model 1.5k Ω in series with 100pF.

Note 7: Condition does not apply to input voltages below 2.7V since this is the minimum input operating voltage.

Note 8: Dropout voltage is measured by reducing V_{IN} until V_O drops 100mV from its normal value.

Typical Performance Characteristics

Unless otherwise specified, $V_{IN} = V_O + 1.5V$, $C_{IN} = C_{OUT} = 10\mu F$ X7R ceramic, $T_J = 25^\circ C$

Applications Section

GENERAL INFORMATION

The LP8340 is a low-dropout, low quiescent current linear regulator. As shown in *Figure 1* it consists of a 1.25V reference, error amplifier, MOSFET driver, PMOS pass transistor and for the fixed output versions, an internal feedback network (R_1/R_2). In addition, the device is protected from overload by a thermal shutdown circuit and a foldback current limit circuit.

The 1.25V reference is connected to the inverting input of the error amplifier. Regulation of the output voltage is

achieved by means of negative feedback to the non-inverting input of the error amplifier. Feedback resistors R_1 and R_2 are either internal or external to the device, depending on whether it is a fixed voltage version or the adjustable version. The negative feedback and high open loop gain of the error amplifier cause the two inputs of the error amp to be virtually equal in voltage. If the output voltage changes due to load changes, the error amplifier and MOSFET driver provide the appropriate drive to the pass transistor to maintain the error amplifier's inputs as virtually equal.

20060903

FIGURE 1. LP8340 Functional Block Diagram

EXTERNAL CAPACITOR

An input capacitor of 1 μ F or greater is required between the LP8340 V_{IN} pin and ground. While 1 μ F will provide adequate bypassing of the V_{IN} supply larger values of input capacitor (i.e. 10 μ F) can provide improved bypassing of power supply noise.

Stable operation can be achieved with an output capacitor of 1 μ F or greater, either ceramic X7R dielectric or aluminum/tantalum electrolytic. While the minimum capacitor value is 1 μ F, the typical output capacitor values selected range from 1 μ F to 10 μ F. The larger values provide improved load-transient response, power supply rejection and stability.

OUTPUT VOLTAGE SETTING (ADJ VERSION ONLY)

The output voltage is set according to the amount of negative feedback (Note that the pass transistor inverts the feedback signal). This feedback is determined by R_1 and R_2 with the resulting output voltage represented by the following equation:

$$V_O = V_{REF} \left[\frac{R_1}{R_2} + 1 \right]$$

Use the following equation to determine the values of R_1 and R_2 for a desired V_{OUT} ($R_2 = 100\text{k}\Omega$ is recommended).

$$R_1 = R_2 \left[\frac{V_O}{1.25\text{V}} - 1 \right]$$

MINIMUM LOAD CURRENT

A minimum load of 100 μ A is required for regulation and stability over the entire operating temperature range. If actual load current falls below 100 μ A it is recommended that a resistor of value $R_L = V_O/100\mu\text{A}$ be placed between V_O and ground.

Applications Section (Continued)

START UP CONSIDERATIONS

Under certain operating conditions, overshoot of V_{OUT} at start-up can occur. The observed overshoot is a function of rise time of V_{IN} waveform, C_{OUT} , start-up load current, and

$V_{IN}-V_{OUT}$ differential. The relationship between these conditions is shown in the Typical Performance Characteristics curves (Minimum Input Voltage Rise Time). V_{IN} rise times above the curve result in <5% overshoot.

Customers are encouraged to check the suitability of LP8340 in their specific application.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

BANNED SUBSTANCE COMPLIANCE

National Semiconductor manufactures products and uses packing materials that meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
