

Features

- **HIGH DENSITY PROGRAMMABLE LOGIC**
 - 2000 PLD Gates
 - 64 and 32 I/O Pin Versions, Four Dedicated Inputs
 - 64 Registers
 - High Speed Global Interconnect
 - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
 - Small Logic Block Size for Random Logic
- **3.3V LOW VOLTAGE 2064 ARCHITECTURE**
 - Interfaces with Standard 5V TTL Devices
 - The 64 I/O Pin Version is Fuse Map Compatible with 5V ispLSI 2064
- **HIGH-PERFORMANCE E²CMOS[®] TECHNOLOGY**
 - $f_{max} = 100\text{MHz}$ Maximum Operating Frequency
 - $t_{pd} = 7.5\text{ns}$ Propagation Delay
 - Electrically Erasable and Reprogrammable
 - Non-Volatile
 - 100% Tested at Time of Manufacture
 - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
 - 3.3V In-System Programmability (ISP[™]) Using Boundary Scan Test Access Port (TAP)
 - Open-Drain Output Option for Flexible Bus Interface Capability, Allowing Easy Implementation of Wired-OR or Bus Arbitration Logic
 - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
 - Reprogram Soldered Devices for Faster Prototyping
- **THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FPGAs**
 - Enhanced Pin Locking Capability
 - Three Dedicated Clock Input Pins
 - Synchronous and Asynchronous Clocks
 - Programmable Output Slew Rate Control
 - Flexible Pin Placement
 - Optimized Global Routing Pool Provides Global Interconnectivity
- **ispDesignEXPERT[™] - LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
 - Superior Quality of Results
 - Tightly Integrated with Leading CAE Vendor Tools
 - Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER[™]
 - PC and UNIX Platforms

Functional Block Diagram

Description

The ispLSI 2064V is a High Density Programmable Logic Device available in 64 and 32 I/O-pin versions. The device contains 64 Registers, four Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2064V features in-system programmability through the Boundary Scan Test Access Port (TAP). The ispLSI 2064V offers non-volatile reprogrammability of the logic, as well as the interconnect, to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 2064V device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1...B7 (see Figure 1). There are a total of 16 GLBs in the ispLSI 2064V device. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. ispLSI 2064V Functional Block Diagram (64-I/O and 32-I/O Versions)

The 64-I/O 2064V contains 64 I/O cells, while the 32-I/O version contains 32 I/O cells. Each I/O cell is directly connected to an I/O pin and can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. Device pins can be safely driven to 5-Volt signal levels to support mixed-voltage systems.

Eight GLBs, 32 or 16 I/O cells, two dedicated inputs and two or one ORPs are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 32 or 16 universal I/O cells by two or one ORPs. Each ispLSI 2064V device contains two Megablocks.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2064V device are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1,

Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

Programmable Open-Drain Outputs

In addition to the standard output configuration, the outputs of the ispLSI 2064V are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified Voh and Vol levels, whereas the open-drain output drives only the specified Vol. The Voh level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. When this fuse is erased (JEDEC "1"), the output is configured as a totem-pole output. When this fuse is programmed (JEDEC "0"), the output is configured as an open-drain. The default configuration when the device is in bulk erased state is totem-pole configuration. The open-drain/totem-pole option is selectable through the ispDesignEXPERT software tools.

Absolute Maximum Ratings ¹

Supply Voltage V_{CC} -0.5 to +5.6V
 Input Voltage Applied..... -0.5 to +5.6V
 Off-State Output Voltage Applied -0.5 to +5.6V
 Storage Temperature -65 to 150°C
 Case Temp. with Power Applied -55 to 125°C
 Max. Junction Temp. (T_J) with Power Applied 150°C

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

| SYMBOL | PARAMETER | | MIN. | MAX. | UNITS |
|----------|--------------------|--|----------------|------|-------|
| V_{CC} | Supply Voltage | Commercial $T_A = 0^\circ\text{C to } +70^\circ\text{C}$ | 3.0 | 3.6 | V |
| | | Industrial $T_A = -40^\circ\text{C to } +85^\circ\text{C}$ | 3.0 | 3.6 | V |
| V_{IL} | Input Low Voltage | | $V_{SS} - 0.5$ | 0.8 | V |
| V_{IH} | Input High Voltage | | 2.0 | 5.25 | V |

Table 2-0005/2064V

Capacitance ($T_A=25^\circ\text{C}$, $f=1.0\text{ MHz}$)

| SYMBOL | PARAMETER | TYPICAL | UNITS | TEST CONDITIONS |
|--------|--|---------|-------|---|
| C_1 | Dedicated Input Capacitance | 10 | pf | $V_{CC} = 3.3\text{V}$, $V_{IN} = 2.0\text{V}$ |
| C_2 | I/O Capacitance | 10 | pf | $V_{CC} = 3.3\text{V}$, $V_{IO} = 2.0\text{V}$ |
| C_3 | Clock and Global Output Enable Capacitance | 13 | pf | $V_{CC} = 3.3\text{V}$, $V_Y = 2.0\text{V}$ |

| I_{IL-PU} | I/O Active Pull-Up Current | $0V \leq V_{IN} \leq V_{IL}$ | – | – | -150 | μA |
| I_{OS}¹ | Output Short Circuit Current | $V_{CC} = 3.3V, V_{OUT} = 0.5V$ | – | – | -100 | mA |
| I_{CC}^{2, 4} | Operating Power Supply Current | $V_{IL} = 0.0V, V_{IH} = 3.0V$ $f_{CLOCK} = 1 \text{ MHz}$ | – | 82 | – | mA |

Table 2-0007/2064V

- One output at a time for a maximum duration of one second. $V_{OUT} = 0.5V$ was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using four 16-bit counters.
- Typical values are at $V_{CC} = 3.3V$ and $T_A = 25^\circ C$.
- Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC} .

ispLSI 2064V Timing Model

Derivations of tsu, th and tco from the Product Term Clock¹

$$\begin{aligned}
 t_{su} &= \text{Logic} + \text{Reg } s_u - \text{Clock (min)} \\
 &= (t_{io} + t_{grp} + t_{20ptxor}) + (t_{gsu}) - (t_{io} + t_{grp} + t_{ptck(min)}) \\
 &= (\#20 + \#22 + \#26) + (\#29) - (\#20 + \#22 + \#35) \\
 4.6 \text{ ns} &= (0.2 + 0.7 + 7.5) + (0.1) - (0.2 + 0.7 + 3.0) \\
 t_h &= \text{Clock (max)} + \text{Reg } h - \text{Logic} \\
 &= (t_{io} + t_{grp} + t_{ptck(max)}) + (t_{gh}) - (t_{io} + t_{grp} + t_{20ptxor}) \\
 &= (\#20 + \#22 + \#35) + (\#30) - (\#20 + \#22 + \#26) \\
 0.7 \text{ ns} &= (0.2 + 0.7 + 4.4) + (3.8) - (0.2 + 0.7 + 7.5) \\
 t_{co} &= \text{Clock (max)} + \text{Reg } c_o + \text{Output} \\
 &= (t_{io} + t_{grp} + t_{ptck(max)}) + (t_{gco}) + (t_{orp} + t_{ob}) \\
 &= (\#20 + \#22 + \#35) + (\#31) + (\#36 + \#38) \\
 10.1 \text{ ns} &= (0.2 + 0.7 + 4.4) + (1.5) + (1.4 + 1.9)
 \end{aligned}$$

Note: Calculations are based on timing specifications for the ispLSI 2064V-100L.

Table 2-0042/2064V

Power Consumption

Power consumption in the ispLSI 2064V device depends on two primary factors: the speed at which the device is operating and the number of Product Terms used.

Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of Four 16-bit Counters
Typical Current at 3.3V, 25° C

I_{CC} can be estimated for the ispLSI 2064V using the following equation:

$$I_{CC}(\text{mA}) = 10 + (\# \text{ of PTs} * 0.556) + (\# \text{ of nets} * \text{Max freq} * 0.0053)$$

Where:

- # of PTs = Number of Product Terms used in design
- # of nets = Number of Signals used in device
- Max freq = Highest Clock Frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions (V_{CC} = 3.3V, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

0127/206

Power-up Considerations

When Lattice 3.3-Volt 2000V devices are used in mixed 5V/3.3V applications, some consideration needs to be given to the power-up sequence. When the I/O pins on the 3.3V ispLSI devices are driven directly by 5V devices, a low impedance path can exist on the 3.3V device between its I/O and V_{cc} pins when the 3.3V supply is not present. This low impedance path can cause current to flow from the 5V device into the 3.3V ispLSI device. The maximum current occurs when the signals on the I/O pins are driven high by the 5V devices. If a large enough current flows through the 3.3V I/O pins, latch-up can occur and permanent device damage may result.

This latch-up condition occurs only during the power-up sequence when the 5V supply comes up before the 3.3V supply. The Lattice 3.3V ispLSI devices are guaranteed to withstand 5V interface signals within the device operating V_{cc} range of 3.0V to 3.6V.

The recommended power-up options are as follows:

Option 1: Ensure that the 3.3V supply is powered-up and stable before the 5V supply is powered up.

Option 2: Ensure that the 5V device outputs are driven to a high impedance or logic low state during power-up.

| GOE 0, GOE 1 | 64, 22 | 62, 13 | Global Output Enable Input Pins |
| Y0, Y1, Y2 | 19, 67, 62 | 10, 65, 60 | Dedicated Clock input. This clock input is connected to one of the clock inputs of all the GLBs in the device. |
| $\overline{\text{RESET}}$ | 20 | 11 | Active Low (0) Reset pin which resets all registers in the device. |
| $\overline{\text{ispEN}}$ | 24 | 15 | Input — Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active. |
| TDI/IN 0 | 25 | 16 | Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an input pin to load programming data into the device. TDI/IN 0 also is used as one of the two control pins for the ISP state machine. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. |
| TMS/IN 1 | 43 | 37 | Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a pin to control the operation of the ISP state machine. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. |
| TDO/IN 2 | 1 | 87 | Output/Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an output pin to read serial shift register data. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. |
| TCK/IN 3 | 61 | 59 | Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a clock pin for the Serial Shift Register. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. |
| GND | 23, 44, 63, 84 | 14, 39, 61, 86 | Ground (GND) |
| VCC | 2, 21, 42, 65 | 12, 36, 63, 89 | Vcc |
| NC ¹ | 66 | 4, 9, 21, 25, 31, 38, 44, 50, 54, 64, 66, 71, 75, 81 88, 94, 100 | No Connect. |

1. NC pins are not to be connected to any active signals, VCC or GND.

Table 2-0002A/2064V

Pin Description

| NAME | 44-PIN PLCC PIN NUMBERS | 44-PIN TQFP PIN NUMBERS | DESCRIPTION |
|---|--|--|---|
| I/O 0 - I/O 3 I/O 4 - I/O 7 I/O 8 - I/O 11 I/O 12 - I/O 15 I/O 16 - I/O 19 I/O 20 - I/O 23 I/O 24 - I/O 27 I/O 28 - I/O 31 | 15, 16, 17, 18, 19, 20, 21, 22, 25, 26, 27, 28, 29, 30, 31, 32, 37, 38, 39, 40, 41, 42, 43, 44, 3, 4, 5, 6, 7, 8, 9, 10 | 9, 10, 11, 12, 13, 14, 15, 16, 19, 20, 21, 22, 23, 24, 25, 26, 31, 32, 33, 34, 35, 36, 37, 38, 41, 42, 43, 44, 1, 2, 3, 4 | Input/Output Pins — These are the general purpose I/O pins used by the logic array. |
| GOE 0/IN 3 GOE 1/Y0 | 2 11 | 40 5 | This pin performs one of two functions. It can be programmed to function as a Global Output Enable pin or a Dedicated Input pin. This pin performs one of two functions. It can be programmed to function as a Global Output Enable or a Dedicated Clock input. This clock input is connected to one of the clock inputs of all the GLBs on the device. |
| RESET/Y1 | 35 | 29 | This pin performs one of two functions. It can be programmed to function as a Dedicated Clock Input that is brought into the Clock Distribution Network and can optionally be routed to any GLB and/or I/O cell on the device, or as an Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device. |
| $\overline{\text{ispEN}}$ TDI/IN 0 TMS/IN 2 TDO/IN 1 TCK/Y2 | 13 14 36 24 33 | 7 8 30 18 27 | Input — Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active. Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an input pin to load programming data into the device. TDI/IN 0 also is used as one of the two control pins for the ISP state machine. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a pin to control the operation of the ISP state machine. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. Output/Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as an output pin to read serial shift register data. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated input pin. Input — This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as a clock pin for the Serial Shift Register. When $\overline{\text{ispEN}}$ is high, it functions as a dedicated clock input. This clock input is brought into the Clock Distribution Network, and can optionally be routed to any GLB and/or I/O cell on the device. |
| GND VCC | 1, 23 12, 34 | 17, 39 6, 28 | Ground (GND) Vcc |
