- When using the products covered herein, please observe the conditions written herein and the precautions outlined in the following paragraphs. In no event shall the company be liable for any damages resulting from failure to strictly adhere to these conditions and precautions.
  - (1) The products covered herein are designed and manufactured for the following application areas. When using the products covered herein for the equipment listed in Paragraph (2), even for the following application areas, be sure to observe the precautions given in Paragraph (2). Never use the products for the equipment listed in Paragraph (3).
    - Office electronics
    - Instrumentation and measuring equipment
    - Machine tools
    - Audiovisual equipment
    - Home appliance
    - Communication equipment other than for trunk lines
  - (2) Those contemplating using the products covered herein for the following equipment which demands high reliability, should first contact a sales representative of the company and then accept responsibility for incorporating into the design fail-safe operation, redundancy, and other appropriate measures for ensuring reliability and safety of the equipment and the overall system.
    - Control and safety devices for airplanes, trains, automobiles, and other transportation equipment
    - Mainframe computers
    - Traffic control systems
    - Gas leak detectors and automatic cutoff devices
    - Rescue and security equipment
    - Other safety devices and safety equipment, etc.
  - (3) Do not use the products covered herein for the following equipment which demands extremely high performance in terms of functionality, reliability, or accuracy.
    - Aerospace equipment
    - Communications equipment for trunk lines
    - Control equipment for the nuclear power industry
    - Medical equipment related to life support, etc.
  - (4) Please direct all queries and comments regarding the interpretation of the above three Paragraphs to a sales representative of the company.
- Please direct all queries regarding the products covered herein to a sales representative of the company.

## 64Mbit (4Mbit×16)

### Page Mode Dual Work Flash MEMORY

- 64M density with 16Bit I/O Interface
- High Performance Reads
  - 60/25ns 8-Word Page Mode
- Configurative 4-Plane Dual Work
  - Flexible Partitioning
  - Read operations during Block Erase or (Page Buffer) Program
  - Status Register for Each Partition
- Low Power Operation
  - 2.7V Read and Write Operations
  - $V_{CCQ}$  for Input/Output Power Supply Isolation
  - Automatic Power Savings Mode Reduces  $I_{CCR}$  in Static Mode
- Enhanced Code + Data Storage
  - 5 $\mu$ s Typical Erase/Program Suspends
- OTP (One Time Program) Block
  - 4-Word Factory-Programmed Area
  - 4-Word User-Programmable Area
- High Performance Program with Page Buffer
  - 16-Word Page Buffer
  - 5 $\mu$ s/Word (Typ.) at 12V  $V_{PP}$
- Operating Temperature 0°C to +70°C
- CMOS Process (P-type silicon substrate)
- Flexible Blocking Architecture
  - Eight 4K-word Parameter Blocks
  - One-hundred and twenty-seven 32K-word Main Blocks
  - Bottom Parameter Location
- Enhanced Data Protection Features
  - Individual Block Lock and Block Lock-Down with Zero-Latency
  - All blocks are locked at power-up or device reset.
  - Absolute Protection with  $V_{PP} \leq V_{PPLK}$
  - Block Erase, Full Chip Erase, (Page Buffer) Word Program Lockout during Power Transitions
- Automated Erase/Program Algorithms
  - 3.0V Low-Power 11 $\mu$ s/Word (Typ.) Programming
  - 12V No Glue Logic 9 $\mu$ s/Word (Typ.) Production Programming and 0.5s Erase (Typ.)
- Cross-Compatible Command Support
  - Basic Command Set
  - Common Flash Interface (CFI)
- Extended Cycling Capability
  - Minimum 100,000 Block Erase Cycles
- 0.8mm pitch 60-Ball CSP
- ETOX<sup>TM</sup>\* Flash Technology
- Not designed or rated as radiation hardened

The product, which is 4-Plane Page Mode Dual Work (Simultaneous Read while Erase/Program) Flash memory, is a low power, high density, low cost, nonvolatile read/write storage solution for a wide range of applications. The product can operate at  $V_{CC}=2.7V-3.6V$  and  $V_{PP}=1.65V-3.6V$  or 11.7V-12.3V. Its low voltage operation capability greatly extends battery life for portable applications.

The product provides high performance asynchronous page mode. It allows code execution directly from Flash, thus eliminating time consuming wait states. Furthermore, its newly configurative partitioning architecture allows flexible dual work operation.

The memory array block architecture utilizes Enhanced Data Protection features, and provides separate Parameter and Main Blocks that provide maximum flexibility for safe nonvolatile code and data storage.

Fast program capability is provided through the use of high speed Page Buffer Program.

Special OTP (One Time Program) block provides an area to store permanent code such as a unique number.

Table 1. Pin Descriptions

Symbol	Type	Name and Function
A <sub>0</sub> -A <sub>21</sub>	INPUT	ADDRESS INPUTS: Inputs for addresses. 64M: A <sub>0</sub> -A <sub>21</sub>
DQ <sub>0</sub> -DQ <sub>15</sub>	INPUT/ OUTPUT	DATA INPUTS/OUTPUTS: Inputs data and commands during CUI (Command User Interface) write cycles, outputs data during memory array, status register, query code, identifier code and partition configuration register code reads. Data pins float to high-impedance (High Z) when the chip or outputs are deselected. Data is internally latched during an erase or program cycle.
CE#	INPUT	CHIP ENABLE: Activates the device's control logic, input buffers, decoders and sense amplifiers. CE#-high (V <sub>IH</sub> ) deselected the device and reduces power consumption to standby levels.
RST#	INPUT	RESET: When low (V <sub>IL</sub> ), RST# resets internal automation and inhibits write operations which provides data protection. RST#-high (V <sub>IH</sub> ) enables normal operation. After power-up or reset mode, the device is automatically set to read array mode. RST# must be low during power-up/down.
OE#	INPUT	OUTPUT ENABLE: Gates the device's outputs during a read cycle.
WE#	INPUT	WRITE ENABLE: Controls writes to the CUI and array blocks. Addresses and data are latched on the rising edge of CE# or WE# (whichever goes high first).
WP#	INPUT	WRITE PROTECT: When WP# is V <sub>IL</sub> , locked-down blocks cannot be unlocked. Erase or program operation can be executed to the blocks which are not locked and not locked-down. When WP# is V <sub>IH</sub> , lock-down is disabled.
V <sub>PP</sub>	INPUT	MONITORING POWER SUPPLY VOLTAGE: V <sub>PP</sub> is not used for power supply pin. With V <sub>PP</sub> ≤ V <sub>PPLK</sub> , block erase, full chip erase, (page buffer) program or OTP program cannot be executed and should not be attempted. Applying 12V ± 0.3V to V <sub>PP</sub> provides fast erasing or fast programming mode. In this mode, V <sub>PP</sub> is power supply pin. Applying 12V ± 0.3V to V <sub>PP</sub> during erase/program can only be done for a maximum of 1,000 cycles on each block. V <sub>PP</sub> may be connected to 12V ± 0.3V for a total of 80 hours maximum. Use of this pin at 12V beyond these limits may reduce block cycling capability or cause permanent damage.
V <sub>CC</sub>	SUPPLY	DEVICE POWER SUPPLY (2.7V-3.6V): With V <sub>CC</sub> ≤ V <sub>LKO</sub> , all write attempts to the flash memory are inhibited. Device operations at invalid V <sub>CC</sub> voltage (see DC Characteristics) produce spurious results and should not be attempted.
V <sub>CCQ</sub>	SUPPLY	INPUT/OUTPUT POWER SUPPLY (2.7V-3.6V): Power supply for all input/output pins.
GND	SUPPLY	GROUND: Do not float any ground pins.
NC		NO CONNECT: Lead is not internally connected; it may be driven or floated.

## NOTES:

1. "X" denotes the operation available.

2. Configurative Partition Dual Work Restrictions:

Status register reflects partition state, not WSM (Write State Machine) state - this allows a status register for each partition. Only one partition can be erased or programmed at a time - no command queuing.  
Commands must be written to an address within the block targeted by that command.

## NOTES:

1. The address A<sub>21</sub>-A<sub>16</sub> are shown in below table for reading the manufacturer code, device code, device configuration code and OTP data.
2. Bottom parameter device has its parameter blocks in the plane0 (The lowest address).
3. Block Address = The beginning location of a block address within the partition to which the Read Identifier Codes/OTP command (90H) has been written.  
DQ<sub>15</sub>-DQ<sub>2</sub> are reserved for future implementation.
4. PCRC=Partition Configuration Register Code.
5. OTP-LK=OTP Block Lock configuration.
6. OTP=OTP Block data.

Table 4. Identifier Codes and OTP Address for Read Operation on Partition Configuration<sup>(1)</sup> (64M-bit device)

1	0	1	00H or 10H or 30H
1	1	1	00H or 10H or 20H or 30H

## NOTES:

1. The address to read the identifier codes or OTP data is dependent on the partition which is selected when writing the Read Identifier Codes/OTP command (90H).
2. Refer to Table 12 for the partition configuration register.

Write	4,5,6	V <sub>IH</sub>	V <sub>IL</sub>	V <sub>IH</sub>	V <sub>IL</sub>	X	X	D <sub>IN</sub>

## NOTES:

1. Refer to DC Characteristics. When  $V_{PP} \leq V_{PPLK}$ , memory contents can be read, but cannot be altered.
2. X can be V<sub>IL</sub> or V<sub>IH</sub> for control pins and addresses, and V<sub>PPLK</sub> or V<sub>PPH1/2</sub> for V<sub>PP</sub>. See DC Characteristics for V<sub>PPLK</sub> and V<sub>PPH1/2</sub> voltages.
3. RST# at GND±0.2V ensures the lowest power consumption.
4. Command writes involving block erase, full chip erase, (page buffer) program or OTP program are reliably executed when  $V_{PP} = V_{PPH1/2}$  and  $V_{CC} = 2.7V - 3.6V$ .
5. Refer to Table 6 for valid D<sub>IN</sub> during a write operation.
6. Never hold OE# low and WE# low at the same timing.
7. Refer to Appendix of LH28F640BF series for more information about query code.

## NOTES:

- Bus operations are defined in Table 5.
- All addresses which are written at the first bus cycle should be the same as the addresses which are written at the second bus cycle.  
X=Any valid address within the device.  
PA=Address within the selected partition.  
IA=Identifier codes address (See Table 3 and Table 4).  
QA=Query codes address. Refer to Appendix of LH28F640BF series for details.  
BA=Address within the block being erased, set/cleared block lock bit or set block lock-down bit.  
WA=Address of memory location for the Program command or the first address for the Page Buffer Program command.  
OA=Address of OTP block to be read or programmed (See Figure 3).  
PCRC=Partition configuration register code presented on the address A<sub>0</sub>-A<sub>15</sub>.
- ID=Data read from identifier codes. (See Table 3 and Table 4).  
QD=Data read from query database. Refer to Appendix of LH28F640BF series for details.  
SRD=Data read from status register. See Table 10 and Table 11 for a description of the status register bits.  
WD=Data to be programmed at location WA. Data is latched on the rising edge of WE# or CE# (whichever goes high first) during command write cycles.  
OD=Data within OTP block. Data is latched on the rising edge of WE# or CE# (whichever goes high first) during command write cycles.  
N-1=N is the number of the words to be loaded into a page buffer.
- Following the Read Identifier Codes/OTP command, read operations access manufacturer code, device code, block lock configuration code, partition configuration register code and the data within OTP block (See Table 3 and Table 4).  
The Read Query command is available for reading CFI (Common Flash Interface) information.
- Block erase, full chip erase or (page buffer) program cannot be executed when the selected block is locked. Unlocked block can be erased or programmed when RST# is V<sub>IH</sub>.
- Either 40H or 10H are recognized by the CUI (Command User Interface) as the program setup.
- Following the third bus cycle, input the program sequential address and write data of "N" times. Finally, input the any valid address within the target block to be programmed and the confirm command (D0H). Refer to Appendix of

LH28F640BF series for details.

8. If the program operation in one partition is suspended and the erase operation in other partition is also suspended, the suspended program operation should be resumed first, and then the suspended erase operation should be resumed next.
9. Full chip erase and OTP program operations can not be suspended. The OTP Program command can not be accepted while the block erase operation is being suspended.
10. Following the Clear Block Lock Bit command, block which is not locked-down is unlocked when WP# is  $V_{IL}$ . When WP# is  $V_{IH}$ , lock-down bit is disabled and the selected block is unlocked regardless of lock-down configuration.
11. Commands other than those shown above are reserved by SHARP for future device implementations and should not be used.

Table 7. Functions of Block Lock<sup>(5)</sup> and Block Lock-Down

Current State					Erase/Program Allowed <sup>(2)</sup>
State	WP#	DQ <sub>1</sub> <sup>(1)</sup>	DQ <sub>0</sub> <sup>(1)</sup>	State Name	
[000]	0	0	0	Unlocked	Yes
[001] <sup>(3)</sup>	0	0	1	Locked	No
[011]	0	1	1	Locked-down	No
[100]	1	0	0	Unlocked	Yes
[101] <sup>(3)</sup>	1	0	1	Locked	No
[110] <sup>(4)</sup>	1	1	0	Lock-down Disable	Yes
[111]	1	1	1	Lock-down Disable	No

## NOTES:

- DQ<sub>0</sub>=1: a block is locked; DQ<sub>0</sub>=0: a block is unlocked.  
DQ<sub>1</sub>=1: a block is locked-down; DQ<sub>1</sub>=0: a block is not locked-down.
- Erase and program are general terms, respectively, to express: block erase, full chip erase and (page buffer) program operations.
- At power-up or device reset, all blocks default to locked state and are not locked-down, that is, [001] (WP#=0) or [101] (WP#=1), regardless of the states before power-off or reset operation.
- When WP# is driven to V<sub>IL</sub> in [110] state, the state changes to [011] and the blocks are automatically locked.
- OTP (One Time Program) block has the lock function which is different from those described above.

## NOTES:

- "Set Lock" means Set Block Lock Bit command, "Clear Lock" means Clear Block Lock Bit command and "Set Lock-down" means Set Block Lock-Down Bit command.
- When the Set Block Lock-Down Bit command is written to the unlocked block (DQ<sub>0</sub>=0), the corresponding block is locked-down and automatically locked at the same time.
- "No Change" means that the state remains unchanged after the command written.
- In this state transitions table, assumes that WP# is not changed and fixed V<sub>IL</sub> or V<sub>IH</sub>.

Table 9. Block Locking State Transitions upon WP# Transition<sup>(4)</sup>

Previous State	Current State				Result after WP# Transition (Next State)

-	[110]	1	1	0	-	[011] <sup>(3)</sup>
-	[111]	1	1	1	-	[011]

## NOTES:

1. "WP#=0→1" means that WP# is driven to V<sub>IH</sub> and "WP#=1→0" means that WP# is driven to V<sub>IL</sub>.
2. State transition from the current state [011] to the next state depends on the previous state.
3. When WP# is driven to V<sub>IL</sub> in [110] state, the state changes to [011] and the blocks are automatically locked.
4. In this state transitions table, assumes that lock configuration commands are not written in previous, current and next state.

## 1 Electrical Specifications

### 1.1 Absolute Maximum Ratings\*

#### Operating Temperature

During Read, Erase and Program ..... 0°C to +70°C (1)

#### Storage Temperature

During under Bias..... -10°C to +80°C

During non Bias..... -65°C to +125°C

#### Voltage On Any Pin

(except  $V_{CC}$  and  $V_{PP}$ )..... -0.5V to  $V_{CC}+0.5V$  (2)

$V_{CC}$  and  $V_{CCQ}$  Supply Voltage ..... -0.2V to +3.9V (2)

$V_{PP}$  Supply Voltage ..... -0.2V to +12.6V (2, 3, 4)

Output Short Circuit Current ..... 100mA (5)

**\*WARNING:** Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.

#### NOTES:

1. Operating temperature is for commercial temperature product defined by this specification.
2. All specified voltages are with respect to GND. Minimum DC voltage is -0.5V on input/output pins and -0.2V on  $V_{CC}$  and  $V_{PP}$  pins. During transitions, this level may undershoot to -2.0V for periods <20ns. Maximum DC voltage on input/output pins is  $V_{CC}+0.5V$  which, during transitions, may overshoot to  $V_{CC}+2.0V$  for periods <20ns.
3. Maximum DC voltage on  $V_{PP}$  may overshoot to +13.0V for periods <20ns.
4.  $V_{PP}$  erase/program voltage is normally 2.7V-3.6V. Applying 11.7V-12.3V to  $V_{PP}$  during erase/program can be done for a maximum of 1,000 cycles on the main blocks and 1,000 cycles on the parameter blocks.  $V_{PP}$  may be connected to 11.7V-12.3V for a total of 80 hours maximum.
5. Output shorted for no more than one second. No more than one output shorted at a time.

### 1.2 Operating Conditions

$V_{PP}$ Voltage when Used as a Logic Control	$V_{PPH1}$	1.65	3.0	3.6	V	1
$V_{PP}$ Supply Voltage	$V_{PPH2}$	11.7	12	12.3	V	1, 2
Main Block Erase Cycling: $V_{PP}=V_{PPH1}$		100,000			Cycles	
Parameter Block Erase Cycling: $V_{PP}=V_{PPH1}$		100,000			Cycles	
Main Block Erase Cycling: $V_{PP}=V_{PPH2}$ , 80 hrs.				1,000	Cycles	
Parameter Block Erase Cycling: $V_{PP}=V_{PPH2}$ , 80 hrs.				1,000	Cycles	
Maximum $V_{PP}$ hours at $V_{PPH2}$				80	Hours	

#### NOTES:

1. See DC Characteristics tables for voltage range-specific specification.
2. Applying  $V_{PP}=11.7V-12.3V$  during a erase or program can be done for a maximum of 1,000 cycles on the main blocks and 1,000 cycles on the parameter blocks. A permanent connection to  $V_{PP}=11.7V-12.3V$  is not allowed and can cause damage to the device.

$V_{LKO}$	$V_{CC}$ Lockout Voltage		1.5			V	

## NOTES:

- All currents are in RMS unless otherwise noted. Typical values are the reference values at  $V_{CC}=3.0V$  and  $T_A=+25^\circ C$  unless  $V_{CC}$  is specified.
- $I_{CCWS}$  and  $I_{CCES}$  are specified with the device de-selected. If read or (page buffer) program is executed while in block erase suspend mode, the device's current draw is the sum of  $I_{CCES}$  and  $I_{CCR}$  or  $I_{CCW}$ . If read is executed while in (page buffer) program suspend mode, the device's current draw is the sum of  $I_{CCWS}$  and  $I_{CCR}$ .
- Block erase, full chip erase, (page buffer) program and OTP program are inhibited when  $V_{PP} \leq V_{PPLK}$ , and not guaranteed in the range between  $V_{PPLK}(\max.)$  and  $V_{PPH1}(\min.)$ , between  $V_{PPH1}(\max.)$  and  $V_{PPH2}(\min.)$  and above  $V_{PPH2}(\max.)$ .
- The Automatic Power Savings (APS) feature automatically places the device in power save mode after read cycle completion. Standard address access timings ( $t_{AVQV}$ ) provide new data when addresses are changed.
- Sampled, not 100% tested.
- $V_{PP}$  is not used for power supply pin. With  $V_{PP} \leq V_{PPLK}$ , block erase, full chip erase, (page buffer) program and OTP program cannot be executed and should not be attempted.  
Applying  $12V \pm 0.3V$  to  $V_{PP}$  provides fast erasing or fast programming mode. In this mode,  $V_{PP}$  is power supply pin and supplies the memory cell current for block erasing and (page buffer) programming. Use similar power supply trace widths and layout considerations given to the  $V_{CC}$  power bus.  
Applying  $12V \pm 0.3V$  to  $V_{PP}$  during erase/program can only be done for a maximum of 1,000 cycles on each block.  $V_{PP}$  may be connected to  $12V \pm 0.3V$  for a total of 80 hours maximum.
- The operating current in dual work is the sum of the operating current (read, erase, program) in each plane.

## NOTES:

1. See AC input/output reference waveform for timing measurements and maximum allowable input slew rate.
2. Sampled, not 100% tested.
3. OE# may be delayed up to  $t_{ELQV} - t_{GLQV}$  after the falling edge of CE# without impact to  $t_{ELQV}$ .
4. Address setup time ( $t_{AVEL}, t_{AVGL}$ ) is defined from the falling edge of CE# or OE# (whichever goes low last).
5. Address hold time ( $t_{ELAX}, t_{GLAX}$ ) is defined from the falling edge of CE# or OE# (whichever goes low last).
6. Specifications  $t_{AVEL}, t_{AVGL}, t_{ELAX}, t_{GLAX}$  and  $t_{EHEL}, t_{GHGL}$  for read operations apply to only status register read operations.

## NOTES:

- The timing characteristics for reading the status register during block erase, full chip erase, (page buffer) program and OTP program operations are the same as during read-only operations. Refer to AC Characteristics for read-only operations.
- A write operation can be initiated and terminated with either CE# or WE#.
- Sampled, not 100% tested.
- Write pulse width ( $t_{WP}$ ) is defined from the falling edge of CE# or WE# (whichever goes low last) to the rising edge of CE# or WE# (whichever goes high first). Hence,  $t_{WP}=t_{WLWH}=t_{ELEH}=t_{WLEH}=t_{ELWH}$ .
- Write pulse width high ( $t_{WPH}$ ) is defined from the rising edge of CE# or WE# (whichever goes high first) to the falling edge of CE# or WE# (whichever goes low last). Hence,  $t_{WPH}=t_{WHWL}=t_{EHEL}=t_{WHEL}=t_{EHWL}$ .
- $V_{PP}$  should be held at  $V_{PP}=V_{PPH1/2}$  until determination of block erase, full chip erase, (page buffer) program or OTP program success (SR.1/3/4/5=0).
- $t_{WHR0}$  ( $t_{EHR0}$ ) after the Read Query or Read Identifier Codes/OTP command= $t_{AVQV}^{+}+100ns$ .
- Refer to Table 6 for valid address and data for block erase, full chip erase, (page buffer) program, OTP program or lock bit configuration.
- $t_{WLWH}$  ( $t_{ELEH}$ ) and  $t_{AVWH}$  ( $t_{AVEH}$ ) values vary depending on the write cycle time ( $t_{AVAV}$ ).

## 1.2.6 Reset Operations

Figure 11. AC Waveform for Reset Operations

Reset AC Specifications ( $V_{CC}=2.7V-3.6V$ ,  $T_A=0^{\circ}C$  to  $+70^{\circ}C$ )

Symbol	Parameter	Notes	Min.	Max.	Unit

$t_{VHQV}$	$V_{CC}$ 2.7V to Output Delay	3		1	ms

## NOTES:

1. A reset time,  $t_{PHQV}$ , is required from the later of SR.7 going "1" or RST# going high until outputs are valid. Refer to AC Characteristics - Read-Only Operations for  $t_{PHQV}$ .
2.  $t_{PLPH}$  is  $<100ns$  the device may still reset but this is not guaranteed.
3. Sampled, not 100% tested.
4. If RST# asserted while a block erase, full chip erase, (page buffer) program or OTP program operation is not executing, the reset will complete within 100ns.
5. When the device power-up, holding RST# low minimum 100ns is required after  $V_{CC}$  has been in predefined range and also has been in stable there.

1. Typical values measured at V<sub>CC</sub>=3.0V, V<sub>PP</sub>=3.0V or 12V, and T<sub>A</sub>=+25°C. Assumes corresponding lock bits are not set. Subject to change based on device characterization.
2. Excludes external system-level overhead.
3. Sampled, but not 100% tested.
4. A latency time is required from writing suspend command (WE# or CE# going high) until SR.7 going "1".
5. If the interval time from a Block Erase Resume command to a subsequent Block Erase Suspend command is shorter than t<sub>ERES</sub> and its sequence is repeated, the block erase operation may not be finished.

			$t_{AVAV}=75ns$	50		ns
26	$t_{WHWL}$ ( $t_{EHEL}$ )	WE# (CE#) Pulse Width High	25		ns	

#### **WORKAROUND**

System designers should consider these specifications.

#### **STATUS**

This is intended to be fixed in future devices.

## A-1 RECOMMENDED OPERATING CONDITIONS

### A-1.1 At Device Power-Up

AC timing illustrated in Figure A-1 is recommended for the supply voltages and the control signals at device power-up. If the timing in the figure is ignored, the device may not operate correctly.

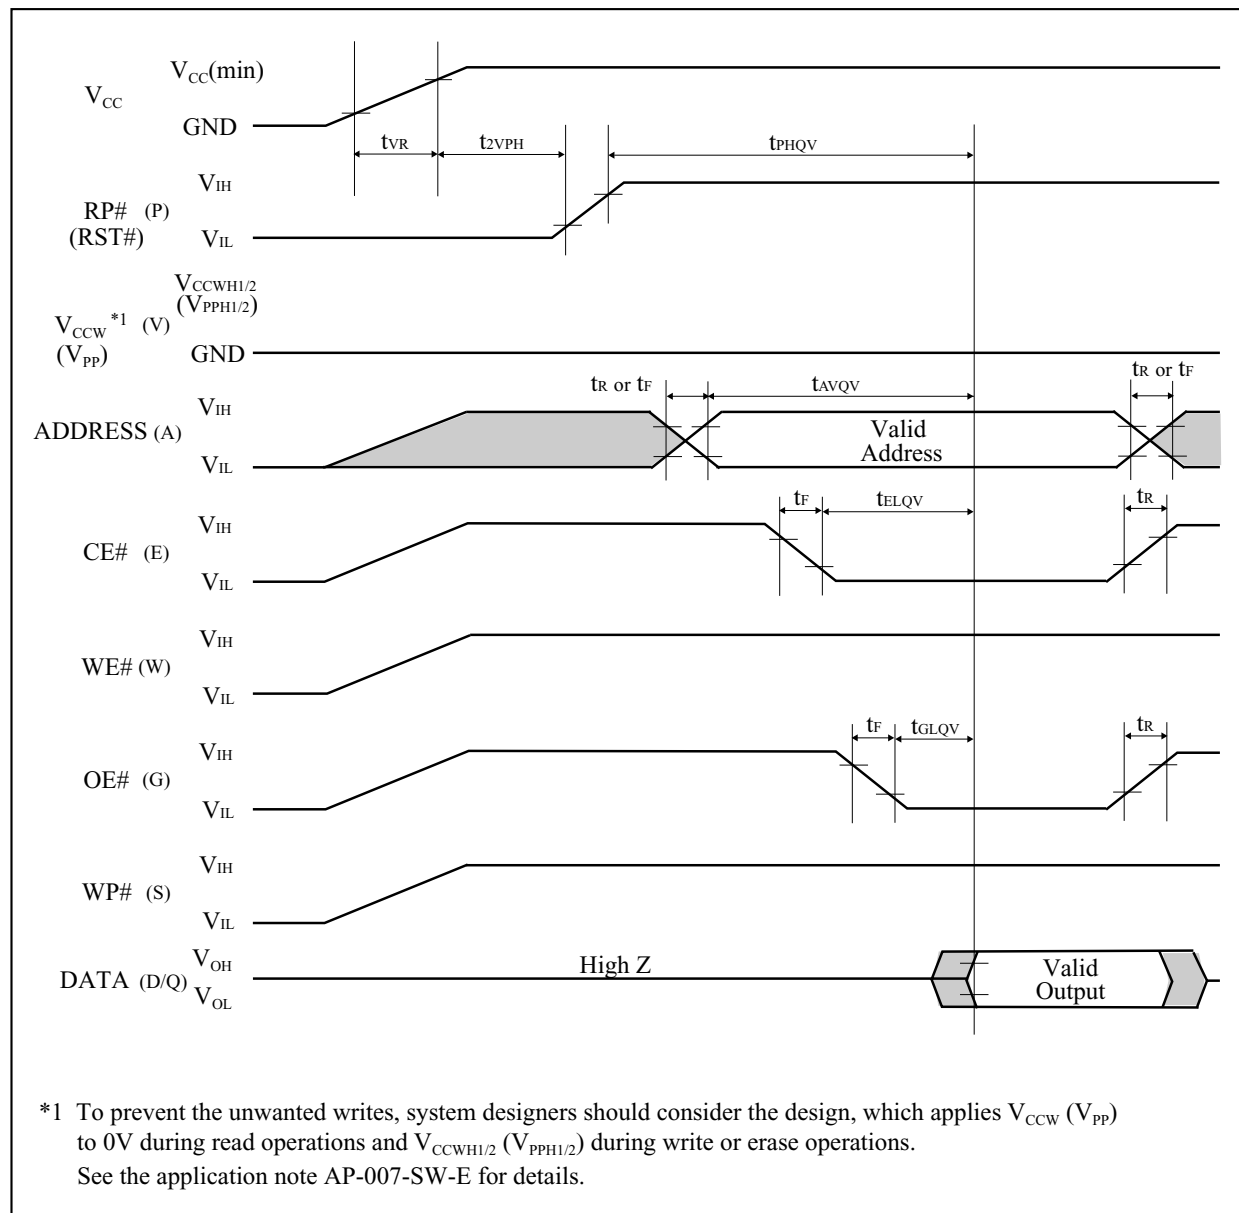

Figure A-1. AC Timing at Device Power-Up

For the AC specifications  $t_{VR}$ ,  $t_R$ ,  $t_F$  in the figure, refer to the next page. See the "ELECTRICAL SPECIFICATIONS" described in specifications for the supply voltage range, the operating temperature and the AC specifications not shown in the next page.

## A-1.1.1 Rise and Fall Time

Symbol	Parameter	Notes	Min.	Max.	Unit
$t_{VR}$	$V_{CC}$ Rise Time	1	0.5	30000	$\mu s/V$
$t_R$	Input Signal Rise Time	1, 2		1	$\mu s/V$
$t_F$	Input Signal Fall Time	1, 2		1	$\mu s/V$

## NOTES:

1. Sampled, not 100% tested.
2. This specification is applied for not only the device power-up but also the normal operations.

## A-1.2 Glitch Noises

Do not input the glitch noises which are below  $V_{IH}$  (Min.) or above  $V_{IL}$  (Max.) on address, data, reset, and control signals, as shown in Figure A-2 (b). The acceptable glitch noises are illustrated in Figure A-2 (a).

Figure A-2. Waveform for Glitch Noises

See the “DC CHARACTERISTICS” described in specifications for  $V_{IH}$  (Min.) and  $V_{IL}$  (Max.).

### A-3 STATUS REGISTER READ OPERATIONS

If AC timing for reading the status register described in specifications is not satisfied, a system processor can check the status register bit SR.15 instead of SR.7 to determine when the erase or program operation has been completed.

Table A-3-1. Status Register Definition (SR.15 and SR.7)

	NOTES:
<p>SR.15 = WRITE STATE MACHINE STATUS: (DQ<sub>15</sub>)</p> <p>1 = Ready in All Partitions</p> <p>0 = Busy in Any Partition</p>	<p>SR.15 indicates the status of WSM (Write State Machine). If SR.15="0", erase or program operation is in progress in any partition.</p>
<p>SR.7 = WRITE STATE MACHINE STATUS FOR EACH PARTITION: (DQ<sub>7</sub>)</p> <p>1 = Ready in the Addressed Partition</p> <p>0 = Busy in the Addressed Partition</p>	<p>SR.7 indicates the status of the partition. If SR.7="0", erase or program operation is in progress in the addressed partition. Even if the SR.7 is "1", the WSM may be occupied by the other partition.</p>
