● Operation notes

(1) The BA5941FP contains a thermal shutdown circuit.

When the chip temperature reaches 175°C (Typ.), the output current is muted.

(2) By having the mute pin (pin 9) voltage open or lowered to 0.5V or below, the output currents can be muted. For normal conditions, have the voltage at pin 9 pull-up to 2V.

(3) If the voltage of the bias pin (pin 2) drops below 1.4V (Typ.), outputs are muted.

For normal conditions, have the voltage above 1.8V.

(4) If the voltage of the thermal shutdown, mute ON, or bias pin drops, the mute is activated; however, in these situations, only the drivers are muted.

Also, the output pin voltage becomes the internal bias voltage (approx. $V_{CC} - VF/2$).

(5) Connect a bypass capacitor (approx. 0.1μF) between the bases of the power supply pins of this IC.

(6) Even though the radiation fins are connected to ground within the package, be sure to also connect them to a ground externally as well.
