

μ A739 • μ A749

Dual Audio Operational Amplifier/Preamplifier

Linear Products

Description

The μ A739 and μ A749 consist of two identical High-Gain Operational Amplifiers constructed on a single silicon chip using the Fairchild Planar epitaxial process. These 3-stage amplifiers use Class A PNP transistor output stages with uncommitted collectors. This enables a variety of loads to be employed for general purpose applications from dc to 10 MHz, where two high performance operational amplifiers are required. In addition, the outputs may be wired-OR for use as a dual comparator or they may function as diodes in low threshold rectifying circuits such as absolute value amplifiers, peak detectors, etc.

- SINGLE OR DUAL SUPPLY OPERATION
- LOW POWER CONSUMPTION
- HIGH GAIN, 25,000 V/V
- LARGE COMMON MODE RANGE, +11 V, -13 V
- EXCELLENT GAIN STABILITY VS.
SUPPLY VOLTAGE
- NO LATCH-UP
- OUTPUT SHORT CIRCUIT PROTECTED
