**DESCRIPTION**

The HY628400A is a high-speed, low power and 4M bits CMOS SRAM organized as 512K words by 8 bits. The HY628400A uses Hynix's high performance twin tub CMOS process technology and was designed for high-speed and low power circuit technology. It is particularly well suited for use in high-density and low power system applications. This device has a data retention mode that guarantees data to remain valid at the minimum power supply voltage of 2.0V.

**FEATURES**

- Fully static operation and Tri-state outputs
- TTL compatible inputs and outputs
- Low power consumption
- Battery backup(L/LL-part)
  - 2.0V(min) data retention
- Standard pin configuration
  - 32pin 525mil SOP
  - 32pin 400mil TSOP-II (Standard and Reversed)

**READ CYCLE 1 (Note 1,4)**

**READ CYCLE 2 (Note 1,2,4)**

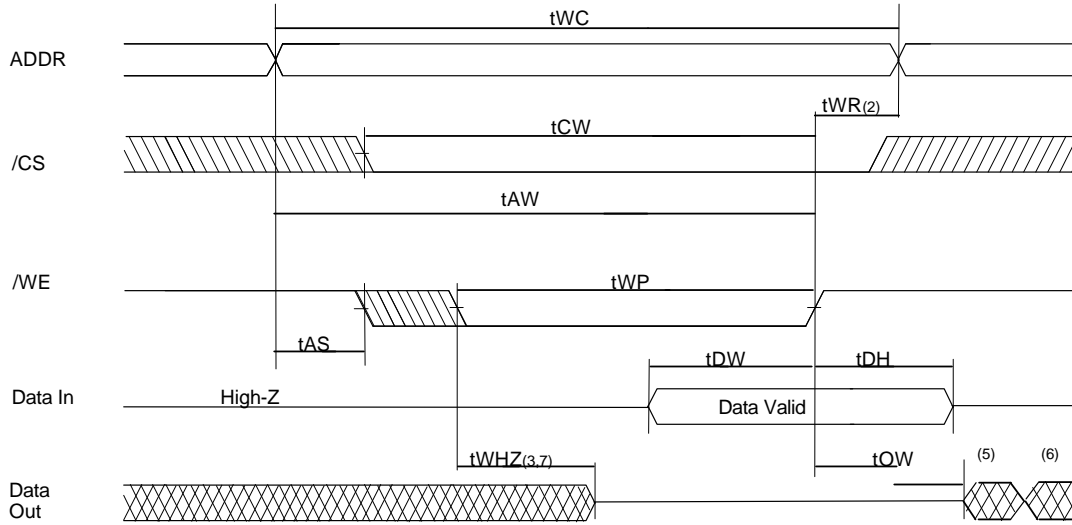

**READ CYCLE 3 (Note 1,2,4)**

**Notes:**

1. A read occurs during the overlap of a low /OE, a high /WE and a low /CS.
2. /OE = V<sub>IL</sub>
3. Transition is measured ± 200mV from steady state voltage.  
This parameter is sampled and not 100% tested.
4. /CS in high for the standby, low for active

WRITE CYCLE 1(1,4,5,8) (/WE Controlled)

WRITE CYCLE 2 (Note 1,4,5,8) (/CS Controlled)

Notes:

1. A write occurs during the overlap of a low /WE and a low /CS.
2. tWR is measured from the earlier of /CS or /WE going high to the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the output must not be applied.
4. If the /CS low transition occur simultaneously with the /WE low transition or after the /WE transition, outputs remain in a high impedance state.
5. Q(data out) is the same phase with the write data of this write cycle.
6. Q(data out) is the read data of the next address.
7. Transition is measured + 200mV from steady state.  
This parameter is sampled and not 100% tested.
8. /CS in high for the standby, low for active
