Video Input Processor (VIP)

SAA7111

1 FEATURES

- Four analog inputs, internal analog source selectors, e.g. $4 \times$ CVBS or $2 \times$ Y/C or ($1 \times$ Y/C and $2 \times$ CVBS)
- Two analog preprocessing channels
- Fully programmable static gain for the main channels or automatic gain control for the selected CVBS or Y/C channel
- Switchable white peak control
- Two built-in analog anti-aliasing filters
- Two 8-bit video CMOS analog-to-digital converters (ADCs)
- On-chip clock generator
- Line-locked system clock frequencies
- Digital PLL for H-sync processing and clock generation
- Requires only one crystal (24.576 MHz) for all standards
- Horizontal and vertical sync detection
- Automatic detection of 50/60 Hz field frequency and automatic switching between standards PAL and NTSC
- Luminance and chrominance signal processing for PAL BGHI, PAL N, PAL M, NTSC M, NTSC N and NTSC 4.43
- User programmable luminance peaking or aperture correction
- Cross-colour reduction for NTSC by chrominance comb filtering
- PAL delay line for correcting PAL phase errors
- Real time status information output (RTCO)
- Brightness Contrast Saturation (BCS) control on-chip
- The YUV (CCIR-601) bus supports a data rate of:
 - $864 \times f_H = 13.5$ MHz for 625 line sources
 - $858 \times f_H = 13.5$ MHz for 525 line sources.
- Data output streams for 16, 12 or 8-bit width with the following formats:
 - 411 YUV (12-bit)
 - 422 YUV (16-bit)
 - 422 YUV [CCIR-656] (8-bit)
 - 565 RGB (16-bit) with dither
 - 888 RGB (24-bit) with special application.
- 720 active samples per line on the YUV bus
- One user programmable general purpose switch on an output pin
- Built in line-21 text slicer
- Power-on control

- Two switchable outputs for the digitized CVBS or Y/C input signals AD1 (7 to 0) and AD2 (7 to 0) via the I²C-bus
- Chip enable function (reset for the clock generator)
- Compatible with memory-based features (line-locked clock)
- Boundary scan test circuit complies with the *IEEE Std. 1149.1 – 1990* (ID-Code = 0 7111 02 B)
- I²C-bus controlled (full read-back ability by an external controller).

2 APPLICATIONS

- Desktop video
- Multimedia
- Digital television
- Image processing
- Video phone.

3 GENERAL DESCRIPTION

The Video Input Processor (VIP) is a combination of a two-channel analog preprocessing circuit including source selection, anti-aliasing filter and ADC, an automatic clamp and gain control, a Clock Generation Circuit (CGC), a digital multi-standard decoder (PAL BGHI, PAL M, PAL N, NTSC M and NTSC N), a brightness/contrast/saturation control circuit and a colour space matrix (see Fig.1).

The CMOS circuit SAA7111, analog front-end and digital video decoder, is a highly integrated circuit for desktop video applications. The decoder is based on the principle of line-locked clock decoding and is able to decode the colour of PAL and NTSC signals into CCIR-601 compatible colour component values. The SAA7111 accepts as analog inputs CVBS or S-video (Y/C) from TV or VTR sources. The circuit is I²C-bus controlled.

7 PINNING

SYMBOL	PINS		I/O	DESCRIPTION
	PLCC68	QFP64		
TRST	1	58	I	Test reset input not (active LOW), for boundary scan test; notes 1, 2, 3 and 4.
TCK	2	59	I	Test clock input for boundary scan test; note 3.
RTCO	3	60	O	Real time control output: contains information about actual system clock frequency, subcarrier frequency and phase and PAL sequence.
IICSA	4	61	I	I ² C-bus slave address select input; 0 → 48H for write, 49H for read, 1 → 4AH for write, 4BH for read.
SDA	5	62	I/O	I ² C-bus serial data input/output.
SCL	6	63	I/O	I ² C-bus serial clock input/output.
n.c.	7	64	–	Not connected.
n.c.	8	–	–	Not connected.
n.c.	9	–	–	Not connected.
n.c.	10	1	–	Not connected.
TDO	11	2	O	Test data output for boundary scan test; note 3.
TDI	12	3	I	Test data input for boundary scan test; note 3.
TMS	13	4	I	Test mode select input for boundary scan test or scan test; note 3.
V _{SSA2}	14	5	GND	Ground for analog supply voltage channel 2.
AI22	15	6	I	Analog input 22.
V _{DDA2}	16	7	P	Positive supply voltage (+5 V) for analog channel 2.
AI21	17	8	I	Analog input 21.
V _{SSA1}	18	9	GND	Ground for analog supply voltage channel 1.
AI12	19	10	I	Analog input 12.
V _{DDA1}	20	11	P	Positive supply voltage (+5 V) for analog channel 1.
AI11	21	12	I	Analog input 11.
V _{SSS}	22	13	GND	Substrate (connected to analog ground).
AOUT	23	14	O	Analog test output; for testing the analog input channels.
V _{DDA0}	24	15	P	Positive supply voltage (+5 V) for internal CGC.
V _{SSA0}	25	16	GND	Ground for internal CGC.
VREF	26	17	O	Vertical reference output signal (I ² C-bit COMPO = 0) or inverse composite blank signal (I ² C-bit COMPO = 1) (enabled via I ² C-bit OEHV).
V _{DD5}	27	18	P	Positive digital supply voltage 5 (+5 V).
V _{SS5}	28	19	GND	Digital ground for positive supply voltage 5.
LLC	29	20	O	Line-locked system clock output (27 MHz).
LLC2	30	21	O	Line-locked clock 1/2 output (13.5 MHz).
CREF	31	22	O	Clock reference output: this is a clock qualifier signal distributed by the CGC for a data rate of LLC2. Using CREF all interfaces on the VPO-bus are able to generate a bus timing with identical phase. If CCIR-656 format is selected (OFTS0 = 1 and OFTS1 = 1) an inverse composite blank signal (pixel qualifier) is provided on this pin.

Video Input Processor (VIP)

SAA7111

SYMBOL	PINS		I/O	DESCRIPTION
	PLCC68	QFP64		
RES	32	23	O	Reset output (active LOW); sets the device into a defined state. All data outputs are in high impedance state. The I ² C-bus is reset (waiting for start condition) note 4.
CE	33	24	I	Chip enable; connection to ground forces a reset.
V _{DD4}	34	25	P	Positive digital supply voltage 4 (+5 V).
V _{SS4}	35	26	GND	Digital ground for positive supply voltage 4.
n.c.	36	–	–	Not connected.
n.c.	37	–	–	Not connected.
HS	38	27	O	Horizontal sync output signal (programmable); the positions of the positive and negative slopes are programmable in 8 LLC increments over a complete line (equals 64 μs) via I ² C-bus bytes HSB and HSS. Fine position adjustment in 2 LLC increments can be performed via I ² C-bits HDEL1 and HDEL0.
RTS1	39	28	O	Two functions output; controlled by I ² C-bit RTSE1. RTSE1 = 0: PAL line identifier (LOW = PAL line); indicates the inverted and non-inverted R – Y component for PAL signals. RTSE1 = 1: H-PLL locked indicator; a high state indicates that the internal horizontal PLL has locked.
RTS0	40	29	O	Two functions output; controlled by I ² C-bit RTSE0. RTSE0 = 0: odd/even field identification (HIGH = odd field). RTSE0 = 1: vertical locked indicator; a HIGH state indicates that the internal VNL has locked.
VS	41	30	O	Vertical sync output signal (enabled via I ² C-bit OEHV); this signal indicates the vertical sync with respect to the YUV output. The HIGH period of this signal is approximately six lines if the vertical noise limiter (VNL) function is active. The positive slope contains the phase information for a deflection controller.
HREF	42	31	O	Horizontal reference output signal (enabled via I ² C-bit OEHV); this signal is used to indicate data on the digital YUV bus. The positive slope marks the beginning of a new active line. The HIGH period of HREF is 720 Y samples long. HREF can be used to synchronize data multiplexer/demultiplexers. HREF is also present during the vertical blanking interval.
V _{SS3}	43	32	GND	Digital ground for positive supply voltage 3.
V _{DD3}	44	33	P	Positive digital supply voltage 3 (+5 V).
VPO (15 to 10)	45 to 50	34 to 39	O	Digital VPO-bus (Video Port Out) output signal; higher bits of the 16-bit YUV-bus or the 16-bit RGB-bus output signal. The output data rate, the format and multiplexing scheme of the VPO-bus are controlled via I ² C-bits OFTS0 and OFTS1. With I ² C-bit VIPB = 1 the six MSBs of the digitized input signal (AD1 [7 to 2]) are connected to these outputs.
V _{SS2}	51	40	GND	Digital ground for positive supply voltage 2.
V _{DD2}	52	41	P	Positive digital supply voltage 2 (+5 V).

Video Input Processor (VIP)

SAA7111

SYMBOL	PINS		I/O	DESCRIPTION
	PLCC68	QFP64		
VPO (9 to 0)	53 to 62	42 to 51	O	Digital VPO-bus output signal; lower bits of the 16-bit YUV-bus or the 16-bit RGB-bus output signal. The output data rate, the format and multiplexing schema of the VPO-bus are controlled via I ² C-bits OFTS0 and OFTS1. With I ² C-bit VIPB = 1 the digitized input signals (AD1 [1 and 0] and AD2 [7 to 0]) are connected to these outputs.
FEI	63	52	I	Fast enable input signal (active LOW); this signal is used to control fast switching on the digital YUV-bus. A HIGH at this input forces the IC to set its Y and UV outputs to the high impedance state; note 4.
GPSW	64	53	O	General purpose switch output; the state of this signal is set via I ² C-bus control and the levels are TTL compatible.
XTAL	65	54	O	Second output terminal of crystal oscillator; not connected if external clock signal is used.
XTALI	66	55	I	Input terminal for 24.576 MHz crystal oscillator or connection of external oscillator with CMOS compatible square wave clock signal.
V _{SS1}	67	56	GND	Digital ground for positive supply voltage 1.
V _{DD1}	68	57	P	Positive digital supply voltage 1 (+5 V).

Notes

1. For board design without boundary scan implementation (pin compatibility with the SAA7110) connect the $\overline{\text{TRST}}$ pin to ground.
2. This pin provides easy initialization of BST circuit. $\overline{\text{TRST}}$ can be used to force the TAP (Test Access Port) controller to the Test-Logic-Reset state (normal operation) at once.
3. In accordance with the *IEEE1149.1* standard the pads TCK, TDI, TMS and $\overline{\text{TRST}}$ are input pads with an internal pull-up transistor and TDO a 3-state output pad.
4. All pin names that carry an 'overscore' have been renamed due to Philips pin name conventions. In previous data sheet versions these pins were marked by the suffix 'N', e.g. $\overline{\text{TRST}}$ = TRSTN.

Video Input Processor (VIP)

SAA7111

Video Input Processor (VIP)

SAA7111

8 FUNCTIONAL DESCRIPTION

8.1 Analog input processing

The SAA7111 offers four analog signal inputs, two analog main channels with clamp circuit, analog amplifier, anti-alias filter and video CMOS ADC (see Fig.6).

8.2 Analog control circuits

The anti-alias filters are adapted to the line-locked clock frequency with help from a filter control. During the vertical blanking, time gain and clamping control are frozen.

8.2.1 CLAMPING

The clamp control circuit controls the correct clamping of the analog input signals. The coupling capacitor is also used to store and filter the clamping voltage. An internal digital clamp comparator generates the information with respect to clamp-up or clamp-down. The clamping levels for the two ADC channels are fixed for luminance (60) and chrominance (128). Clamping time in normal use is set with the HCL pulse at the back porch of the video signal.

8.2.2 GAIN CONTROL

Signal (white) peak control limits the gain at signal overshoots. The flow charts (see Figs 10 and 11) show more details of the AGC. The influence of supply voltage variation within the specified range is automatically eliminated by clamp and automatic gain control.

The gain control circuit receives (via the I²C-bus) the static gain levels for the two analog amplifiers or controls one of these amplifiers automatically via a built-in automatic gain

control (AGC) as part of the Analog Input Control (AICO). The AGC (automatic gain control for luminance) is used to amplify a CVBS or Y signal to the required signal amplitude, matched to the ADCs input voltage range. The AGC active time is the sync bottom of the video signal.

8.3 Chrominance processing

The 8-bit chrominance signal is fed to the multiplication inputs of a quadrature demodulator, where two subcarrier signals from the local oscillator DTO1 are applied (0 and 90° phase relationship to the demodulator axis). The frequency is dependent on the present colour standard. The output signals of the multipliers are low-pass filtered (four programmable characteristics) to achieve the desired bandwidth for the colour difference signals.

The colour difference signals are fed to the Brightness/Contrast/Saturation block (BCS), which includes the following five functions;

1. AGC (automatic gain control for chrominance)
2. Chroma amplitude matching [different gain factors for (R-Y) and (B-Y) to achieve CCIR-601 levels Cr and Cb]
3. Chroma saturation control
4. Luminance contrast and brightness
5. Limiting YUV to the values 1 (min.) and 254 (max.) to fulfil CCIR-601 requirements.

Video Input Processor (VIP)

SAA7111

The burst processing block provides the feedback loop of the chroma PLL and contains;

- Burst gate accumulator
- Colour identification and killer
- Comparison nominal/actual burst amplitude
- Loop filter chroma gain control
- Loop filter chroma PLL
- PAL sequence generation
- Increment generation for DTO1 with divider to generate stable subcarrier for non-standard signals.

The chroma comb filter block eliminates crosstalk between the chrominance channels in accordance with the PAL standard requirements. For NTSC colour standards the chroma comb filter can be used to eliminate crosstalk from luminance to chrominance (cross-colour) for vertical structures. The comb filter can be switched off if desired.

The resulting signals are fed to the variable Y-delay compensation, RGB matrix, dithering circuit and output interface, which contains the VPO output formatter and the output control logic (see Fig.7).

8.4 Luminance processing

The 8-bit luminance signal, a digital CVBS format or a luminance format (S-VHS, HI8), is fed through a switchable prefilter. High frequency components are emphasized to compensate for loss. The following chrominance trap filter ($f_0 = 4.43$ or 3.58 MHz centre frequency selectable) eliminates most of the colour carrier signal, therefore, it must be bypassed for S-video (S-VHS, HI8) signals.

The high frequency components of the luminance signal can be peaked (control for sharpness improvement via I²C-bus) in two band-pass filters with selectable transfer characteristic. This signal is then added to the original (unpeaked) signal. A switchable amplifier achieves common DC amplification, because the DC gains are different in both chrominance trap modes. The improved luminance signal is fed to the BCS control located in the chrominance processing block (see Fig.8).

8.5 RGB matrix

Y, Cr and Cb-data are converted after interpolation into RGB data in accordance with CCIR-601 recommendation. The realized matrix equations consider the digital quantization:

$$R = Y + 1.371 Cr$$

$$G = Y - 0.336 Cb - 0.698 Cr$$

$$B = Y + 1.732 Cb.$$

After dithering (noise shaping) the RGB data is fed to the output interface within the VPO-bus output formatter.

8.6 VPO-bus (digital outputs)

The 16-bit VPO-bus transfers digital data from the output interfaces to a feature box or a field memory, a digital colour space converter (SAA7192 DCSC), a video enhancement and digital-to-analog processor (SAA7165 VEDA2) or a colour graphics board (Targa-format) as a graphical user interface.

The output data formats are controlled via the I²C-bus bits OFTS0, OFTS1 and RGB888. Timing for the data stream formats, 411 YUV (12-bit), 422 YUV (16-bit), 565 RGB (16-bit) and 888 RGB (24-bit) with an LLC2 data rate, is achieved by marking each second positive rising edge of the clock LLC in conjunction with CREF (clock reference) (except RGB 888, see special application in Fig.27). The higher output signals VPO15 to VPO8 in the YUV format perform the digital luminance signal. The lower output signals VPO7 to VPO0 in the YUV format are the bits of the multiplexed colour difference signals (B-Y) and (R-Y). The arrangement of the RGB 565 and RGB 888 data stream bits on the VPO-bus is given in Table 5.

The data stream format 422 YUV (the 8 higher output signals VPO15 to VPO8) in LLC data rate fulfils the CCIR-656 standard with its own timing reference code at the start and end of each video data block.

A pixel in the format tables is the time required to transfer a full set of samples. In the event of a 4 : 2 : 2 format two luminance samples are transmitted in comparison to one (B-Y) and one (R-Y) sample within a pixel. The time frames are controlled by the HREF signal.

Video Input Processor (VIP)

SAA7111

Fast enable is achieved by setting input $\overline{\text{FEI}}$ to LOW. The signal is used to control fast switching on the digital VPO-bus. HIGH on this pin forces the YUV outputs to a high-impedance state (see Figs 15 and 17).

The digitized analog PAL or NTSC signals AD1 (7 to 0) and AD2 (7 to 0) are connected directly to the VPO-bus via I²C-bit VIPB = 1.

AD1 (7 to 0) → VPO (15 to 8) and
AD2 (7 to 0) → VPO (7 to 0)

The selection of the analog input channels are controlled via I²C-bus subaddress 02 MODE select.

8.7 Synchronization

The prefiltered luminance signal is fed to the synchronization stage. Its bandwidth is reduced to 1 MHz in a low-pass filter. The sync pulses are sliced and fed to the phase detectors where they are compared with the sub-divided clock frequency. The resulting output signal is applied to the loop filter to accumulate all phase deviations. Internal signals (e.g. HCL and HSY) are generated in accordance with analog front-end requirements. The output signals HS, VS, and PLIN are locked to the timing reference, guaranteed between the input signal and the HREF signal, as further improvements to the circuit may change the total processing delay. It is therefore not recommended to use them for applications which require absolute timing accuracy on the input signals. The loop filter signal drives an oscillator to generate the line frequency control signal LFCO (see Fig.8).

8.8 Clock generation circuit

The internal CGC generates all clock signals required for the video input processor. The internal signal LFCO is a digital-to-analog converted signal provided by the horizontal PLL. It is the multiple of the line frequency ($6.75 \text{ MHz} = 432 \times f_h$). Internally the LFCO signal is multiplied by a factor of 2 or 4 in the PLL circuit (including phase detector, loop filtering, VCO and frequency divider) to obtain the LLC and LLC2 output clock signals. The rectangular output clocks have a 50% duty factor (see Fig.22).

8.9 Power-on reset and CE input

A missing clock, insufficient digital or analog V_{DDA0} supply voltages (below 3.5 V) will initiate the reset sequence; all outputs are forced to 3-state. The indicator output RES is LOW for approximately 128 LLC after the internal reset and can be applied to reset other circuits of the digital TV system.

It is possible to force a reset by pulling the CE (chip enable) to ground. After the rising edge of CE and sufficient power supply voltage, the outputs LLC, LLC2, CREF, RTCO, RTS0, RTS1, GPSW and SDA return from 3-state to active, while HREF, VREF, HS and VS remain in 3-state and have to be activated via I²C-bus programming (see Table 4).

8.10 RTCO output

The real time control and status output signal contains serial information about the actual system clock (increment of the HPLL), subcarrier frequency [increment and phase (via reset) of the FSC-PLL] and PAL sequence bit. The signal can be used for various applications in external circuits, e.g. in a digital encoder to achieve clean encoding (see Fig.16).

8.11 The Line-21 text slicer

The text slicer block detects and acquires Line-21 closed captioning data from a 525-line CVBS signal. Extended data services on Line-21 Field 2 are also supported. If valid data is detected the two data bytes are stored in two I²C-bus registers. A parity check is also performed and the result is stored in the MSB of the corresponding byte. A third I²C-bus register is provided for data valid and data ready flags. The two bits F1VAL and F2VAL indicate that the input signal carries valid Closed Captioning data on the corresponding fields. The data ready bits F1RDY and F2RDY have to be evaluated if asynchronous I²C-bus reading is used.

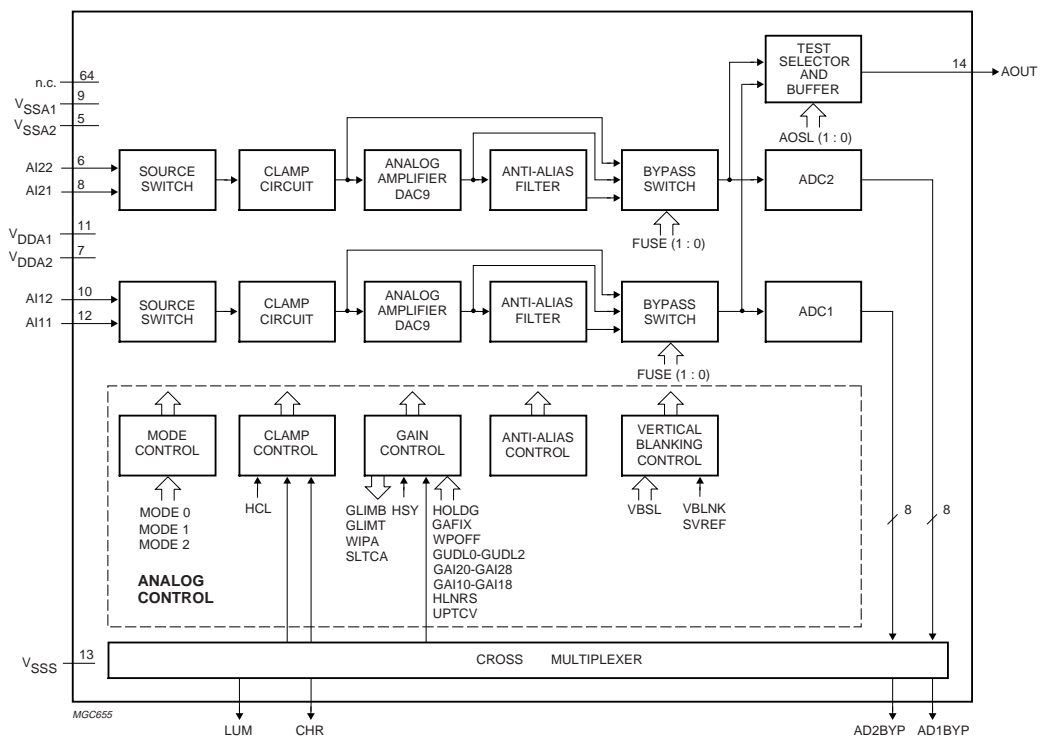

8.11.1 SUGGESTIONS FOR I²C-BUS INTERFACE OF THE DISPLAY SOFTWARE READING LINE-21 DATA

There are two methods by which the software can acquire the data;

1. Synchronous reading once per frame (or once per field): It can use either the rising edge (Line-21 Field 1) or both edges (Line-21 Field 1 or 2) of the ODD signal (pin RTS0) to initiate an I²C-bus read transfer of the three registers 1A, 1B and 1C
2. Asynchronous reading: It can poll either the F1RDY bit (Line-21 Field 1) or both F1RDY/F2RDY bits (Line-21 Field 1 or 2). After valid data has been read the corresponding F*RDY bit is set to LOW until new data has arrived. The polling frequency has to be slightly higher than the frame or field frequency, respectively.

CLOCK	FREQUENCY (MHz)
XTAL	24.576
LLC	27
LLC2	13.5
LLC4	6.75
LLC8	3.375

13 CLOCK SYSTEM**13.1 Clock generation circuit**

The internal CGC generates the system clocks LLC, LLC2 and the clock reference signal CREF. The internal generated LFCO (triangular waveform) is multiplied by 2 or 4 via the analog PLL (including phase detector, loop filter, VCO and frequency divider). The rectangular output signals have a 50% duty factor.

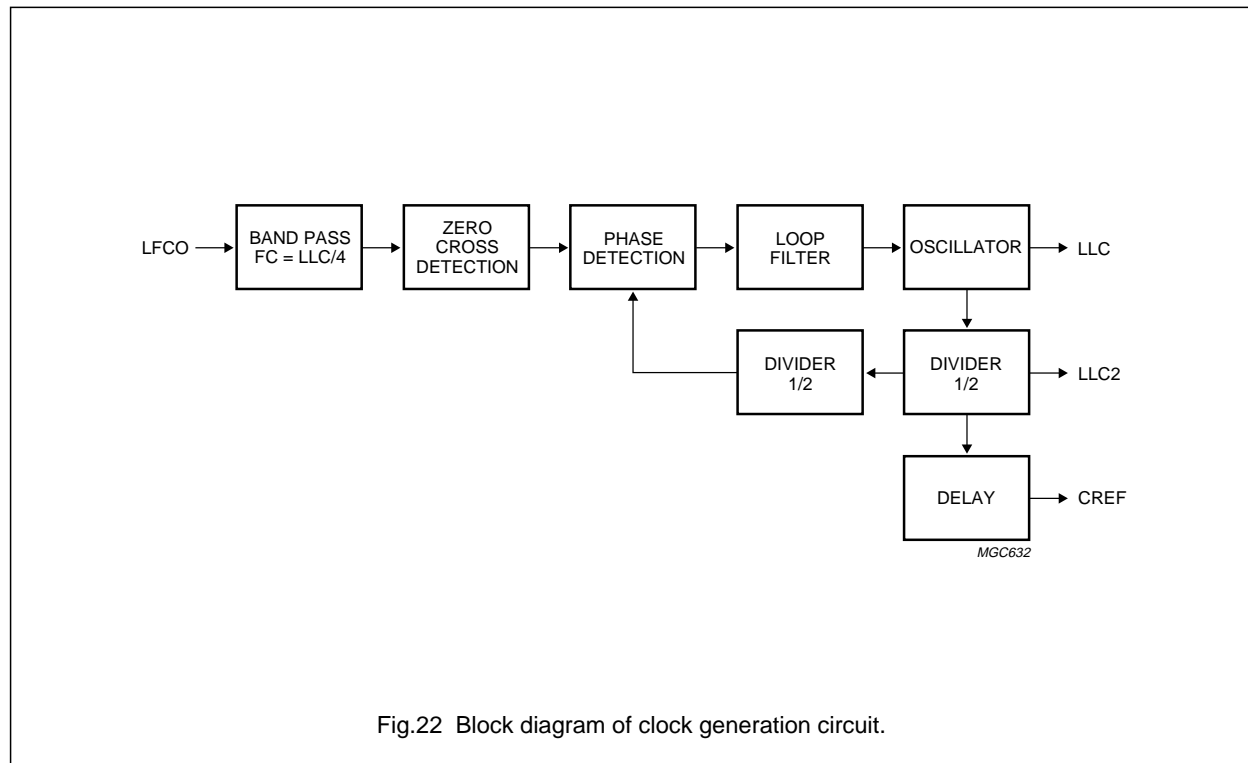

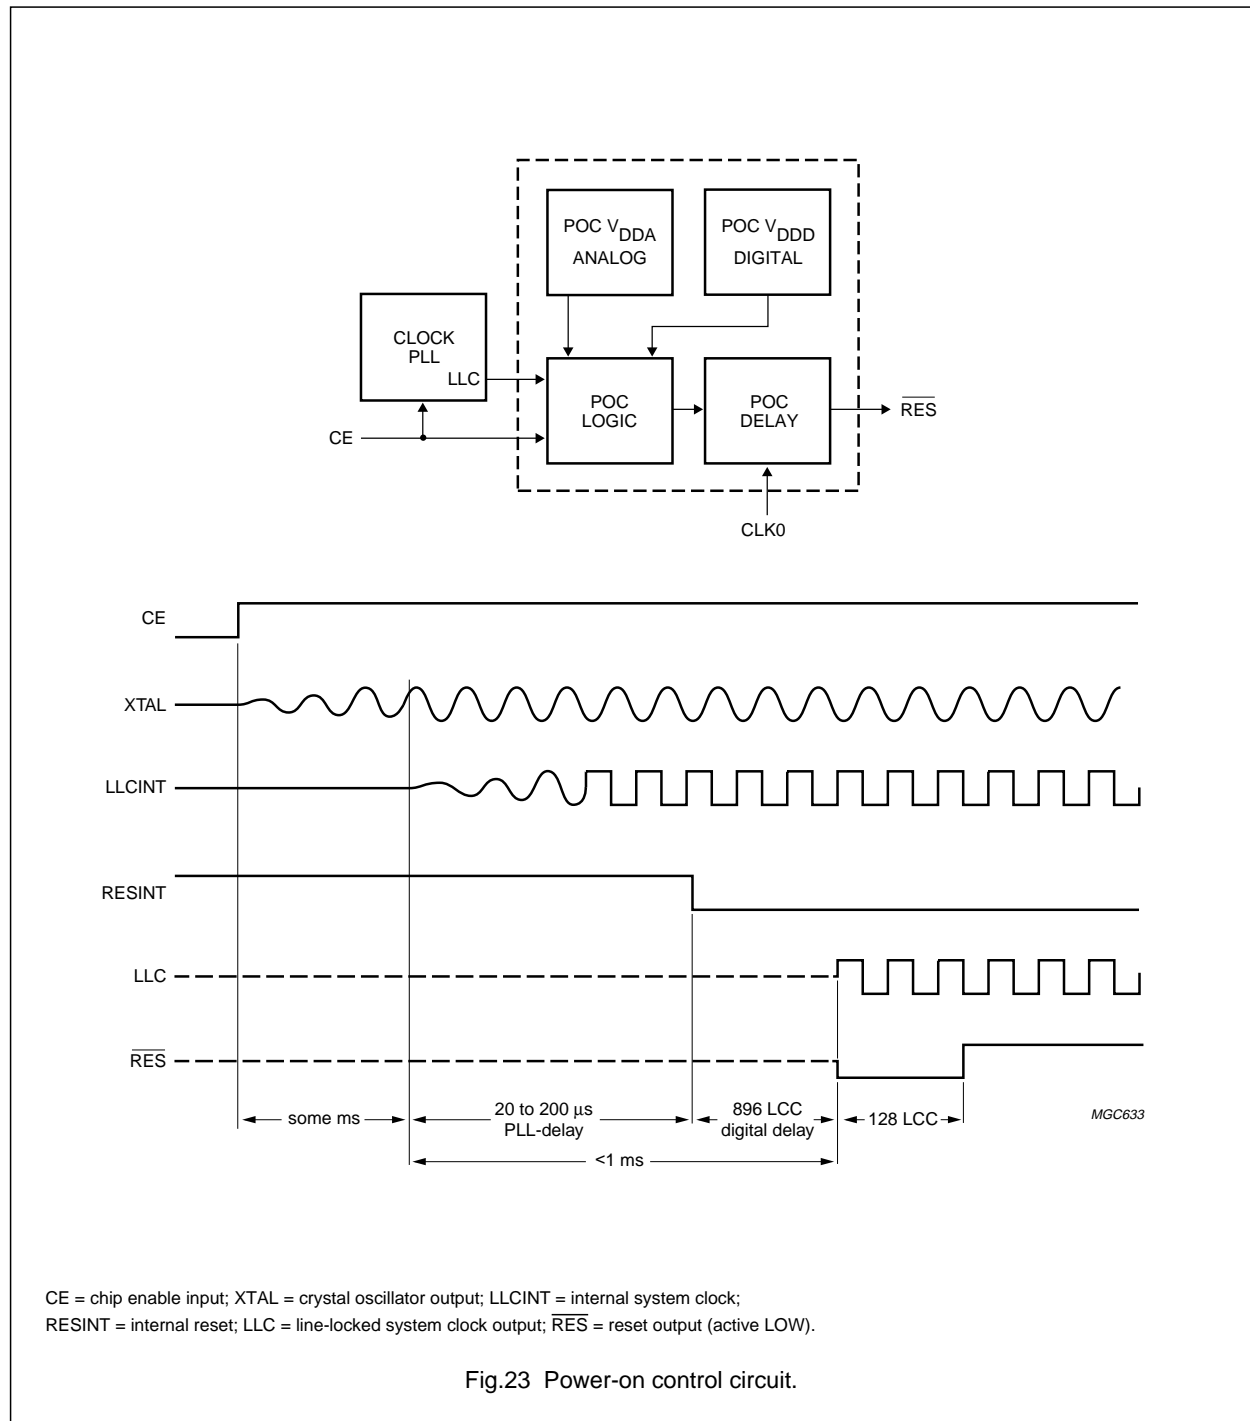

Fig.22 Block diagram of clock generation circuit.

Video Input Processor (VIP)

SAA7111

13.2 Power-on control

Power-on reset is activated at power-on, chip enable, PLL clock generation failure and if the supply voltage falls below 3.5 V. The RES signal can be applied to reset other circuits of the digital picture processing system.

Video Input Processor (VIP)

SAA7111

Table 4 Power-on control sequence

INTERNAL POWER-ON CONTROL SEQUENCE	PIN OUTPUT STATUS	FUNCTION
Directly after power-on asynchronous reset	VPO15 to VPO0, RTCO, RTS0, RTS1, GPSW, HREF, VREF, HS, VS, LLC, LLC2 and CREF are in high-impedance state	direct switching to high impedance for 20 to 200 ms
Synchronous reset sequence	LLC, LLC2, CREF, RTCO, RTS0, RTS1, GPSW and SDA become active; VPO15 to VPO0, HREF, VREF, HS and VS are held in high-impedance state	internal reset sequence
Status after power-on control sequence	VPO15 to VPO0, HREF, VREF, HS and VS are held in high-impedance state	after power-on (reset sequence) a complete I ² C-bus transmission is required

15 APPLICATION INFORMATION

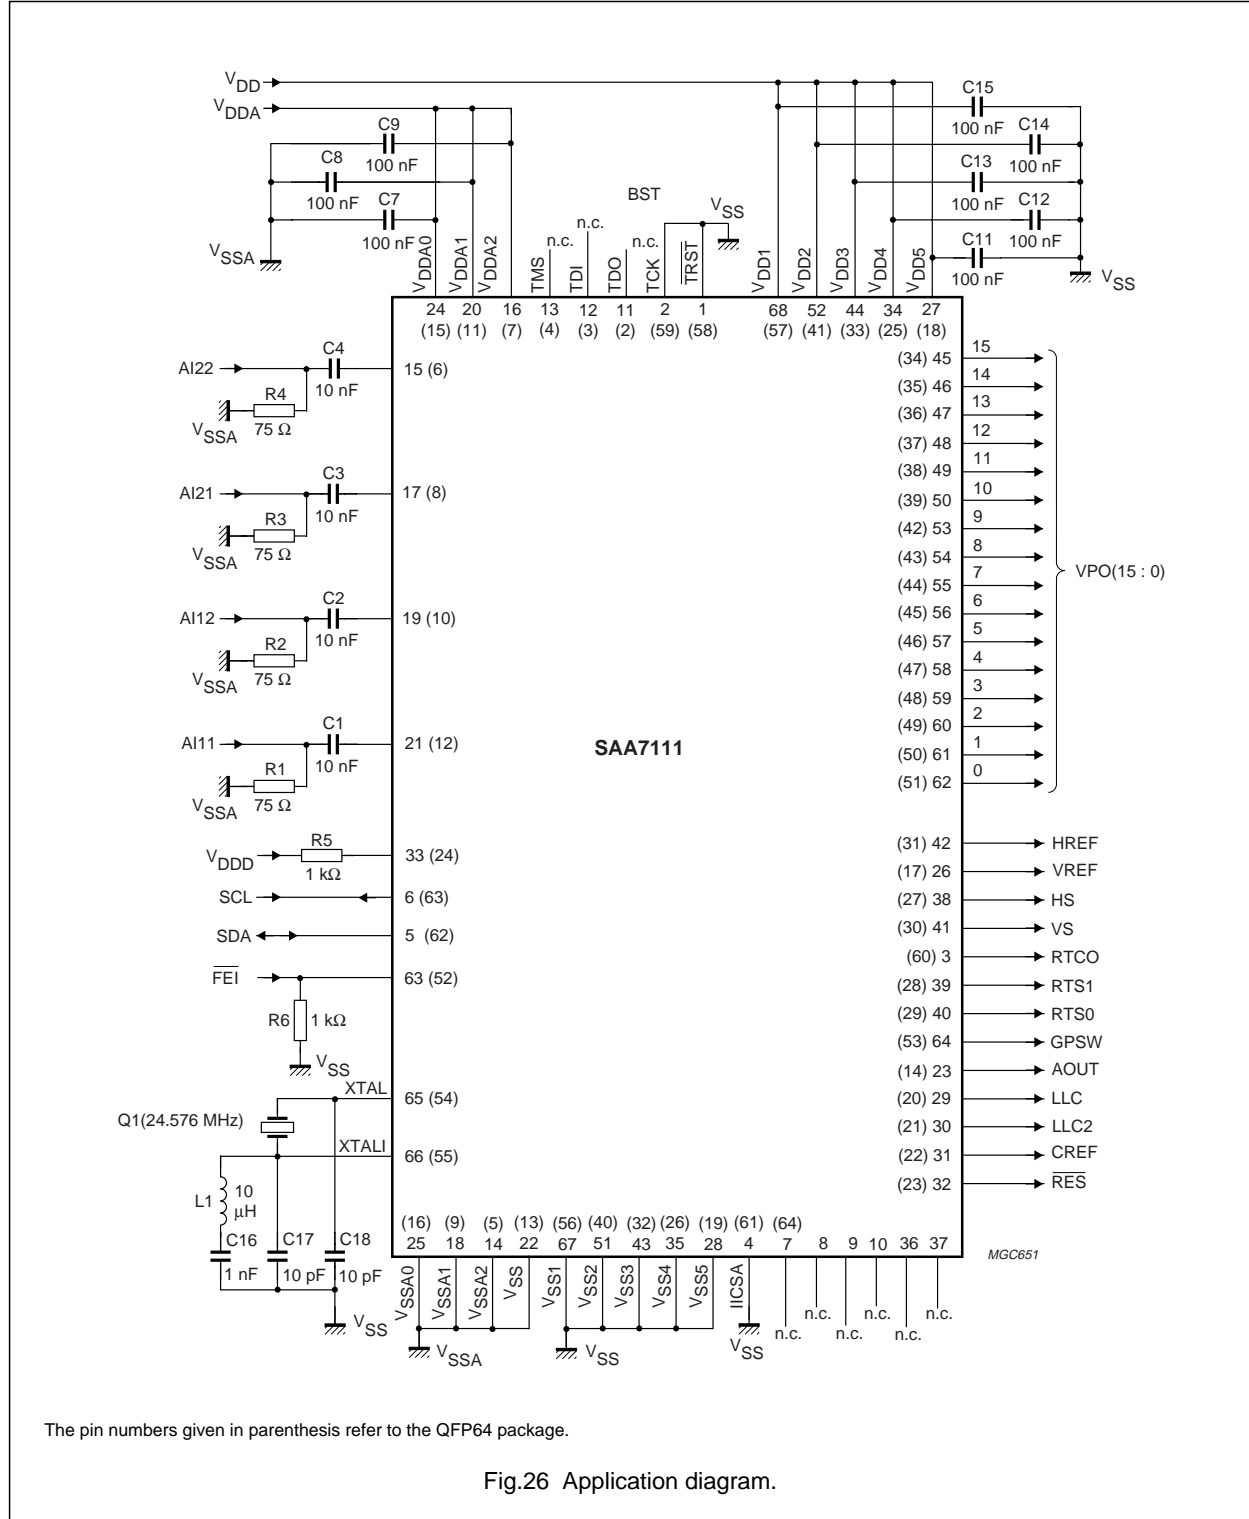

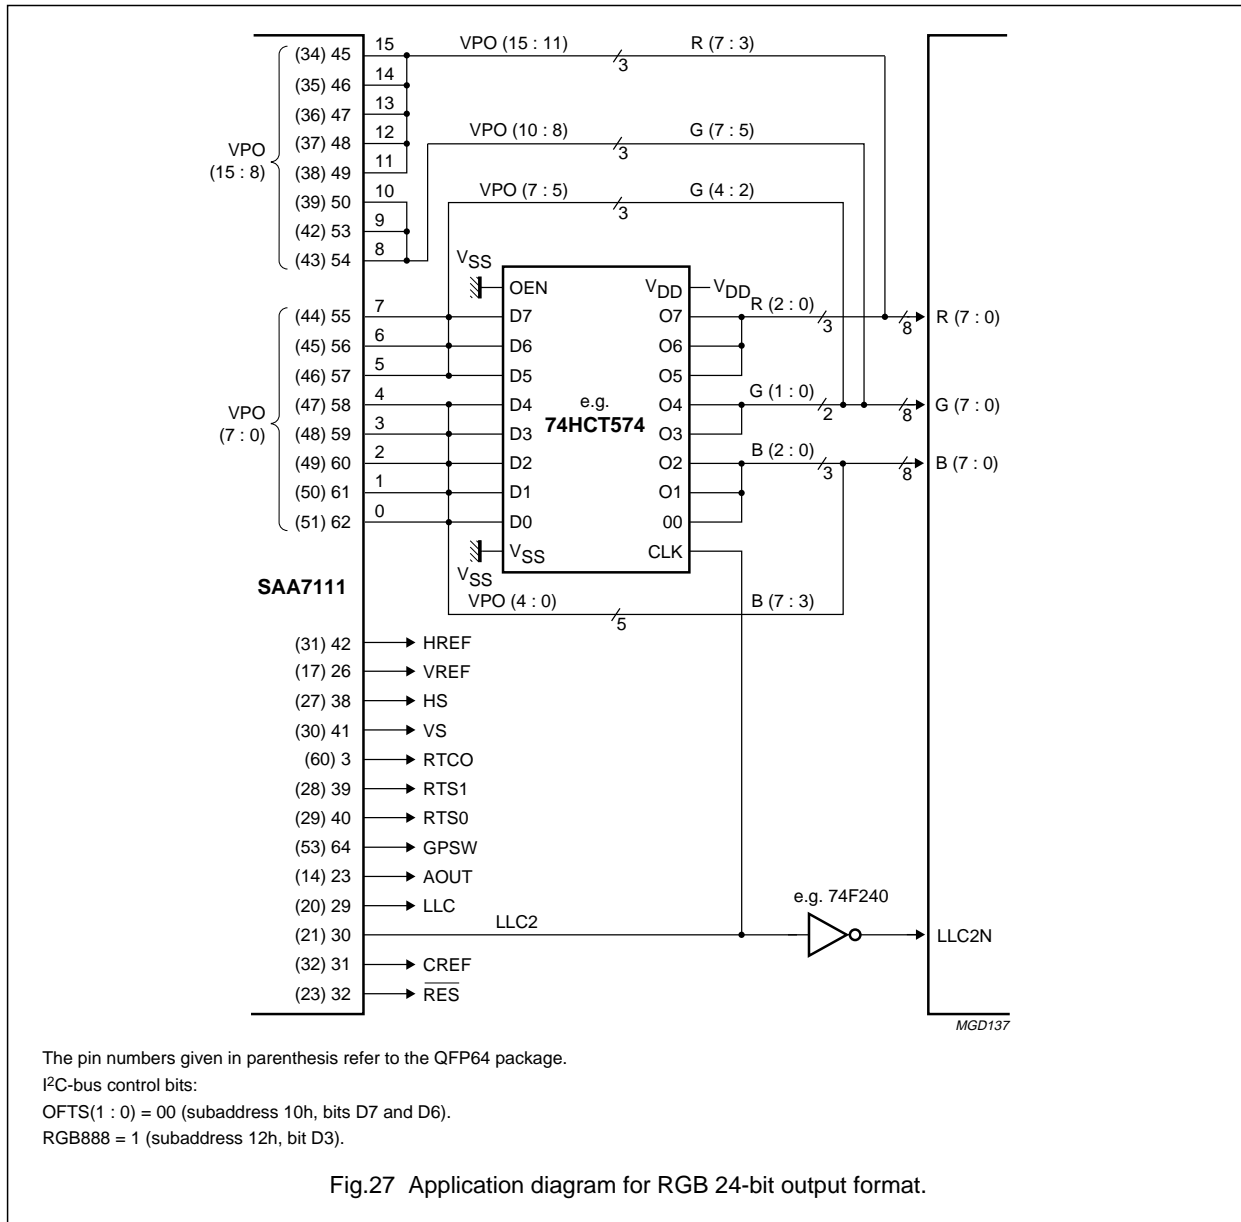

Fig.26 Application diagram.

Video Input Processor (VIP)

SAA7111

15.1 Layout hints

Use separate ground planes for analog and digital ground. Connect these planes at one point directly under the device, by using a zero Ω resistor. Use separate supply lines for analog and digital supply. Place the supply decoupling capacitors nearby the supply pins.

Place the coupling (clamp) capacitors close to the analog input pins. Place the termination resistors close to the coupling capacitors. Care should be exercised concerning the hidden layout capacitors around the crystal application. To avoid reflection effects use serial resistors in the clock, sync and data lines.

Video Input Processor (VIP)

16 I²C-BUS DESCRIPTION**16.1 I²C-bus format****Table 6** Write procedure

S	SLAVE ADDRESS W	ACK(s)	SUBADDRESS	ACK(s)	DATA (N BYTES)	ACK(s)	P
---	-----------------	--------	------------	--------	----------------	--------	---

Table 7 Read procedure (combined format)

S	SLAVE ADDRESS W	ACK(s)	SUBADDRESS	ACK(s)		
Sr	SLAVE ADDRESS R	ACK(s)	DATA (N BYTES)	ACK(m)	P	

Table 8 Description of I²C-bus format

CODE	DESCRIPTION	
S	START condition	
Sr	repeated START condition	
Slave address W	0100 1000b (IICSA = LOW) or 0100 1010b (IICSA = HIGH)	
Slave address R	0100 1001b (IICSA = LOW) or 0100 1011b (IICSA = HIGH)	
ACK(s)	acknowledge generated by the slave	
ACK(m)	acknowledge generated by the master	
Subaddress	subaddress byte; see Table 9	
Data	data byte, see; note 1 and Table 9	
P	STOP condition	
X = LSB slave address	read/write control bit; X = 0, order to write (the circuit is slave receiver); X = 1, order to read (the circuit is slave transmitter)	
Slave address	read = 49H or 4BH; note 2	
	write = 48H or 4AH	
	IICSA = 0 or 1	
Subaddress	00H chip version	read and write; note 3
	01H reserved	–
	02H to 05H front-end part	read and write
	06H to 12H decoder part	read and write
	13H to 19H reserved	–
	1AH to 1CH Line-21 text slicer part	read only
	1DH to 1EH reserved	–
	1FH status byte	read only

Notes

1. If more than one byte DATA is transmitted then the auto-increment of the subaddress is performed.
2. During slave transmitter mode the SCL-LOW period may be extended by pulling SCL to LOW (in accordance with the I²C-bus specification).
3. The I²C-bus subaddress 00 has to be initialized with 0 before being read.

20 SOLDERING

20.1 Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398 652 90011).

20.2 Reflow soldering

Reflow soldering techniques are suitable for all PLCC and QFP packages.

The choice of heating method may be influenced by larger PLCC or QFP packages (44 leads, or more). If infrared or vapour phase heating is used and the large packages are not absolutely dry (less than 0.1% moisture content by weight), vaporization of the small amount of moisture in them can cause cracking of the plastic body. For more information, refer to the Drypack chapter in our "Quality Reference Handbook" (order code 9397 750 00192).

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 50 and 300 seconds depending on heating method. Typical reflow peak temperatures range from 215 to 250 °C.

20.3 Wave soldering

20.3.1 PLCC

Wave soldering techniques can be used for all PLCC packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream corners.

20.3.2 QFP

Wave soldering is **not** recommended for QFP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

CAUTION

Wave soldering is NOT applicable for all QFP packages with a pitch (e) equal or less than 0.5 mm.

If wave soldering cannot be avoided, for QFP packages with a pitch (e) larger than 0.5 mm, the following conditions must be observed:

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The footprint must be at an angle of 45° to the board direction and must incorporate solder thieves downstream and at the side corners.**

20.3.3 METHOD (PLCC AND QFP)

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

20.4 Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

21 DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

22 LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

23 PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
