

LXT360/361 Integrated T1/E1 LH/SH Transceivers

for DS1/DSX-1/CSU or NTU/ISDN PRI Applications

General Description

The LXT360 and LXT361 are the first full-featured, fully integrated, combination transceivers for E1 ISDN Primary Rate Interface and T1 long- and short-haul applications. They operate over 0.63 mm (22 AWG) twisted-pair cables for 0 to 2 km (6 kft) and offer Line Build-Outs and pulse equalization settings for all T1 and E1 Line Interface Unit (LIU) applications.

The LXT360 and LXT361 are identical except for their control options. The LXT361 offers an Intel or Motorola compatible parallel port for microprocessor control. The LXT360 provides both a serial port for microprocessor control and a hardware control mode for stand alone operation. Both incorporate advanced crystal-less digital jitter attenuation in either the transmit or receive data path starting at 3 Hz. B8ZS/HDB3 encoding/decoding and unipolar or bipolar data I/O are available. Both LIUs provide loss of signal monitoring and a variety of diagnostic loopback modes.

The LXT360/361 uses an advanced double-poly, double-metal fabrication process and requires only a single 5-volt power supply.

Applications

- ISDN Primary Rate Interface (ISDN PRI)
- CSU/NTU interface to T1/E1 Service
- Wireless Base Station interface
- T1/E1 LAN/WAN bridge/routers
- T1/E1 Mux; Channel Banks
- Digital Loop Carrier - Subscriber Carrier Systems

Features

- Fully integrated transceivers for Long- or Short-Haul T1 or E1 interfaces
- Crystal-less digital jitter attenuation
 - Select either transmit or receive path
 - No crystal or high speed external clock required
- Meet or exceed specifications in ANSI T1.403 and T1.408; ITU I.431, G.703, G.736, G.775 and G.823; ETSI 300-166 and 300-233; and AT&T Pub 62411
- Support 75 Ω (E1 coax), 100 Ω (T1 twisted-pair) and 120 Ω (E1 twisted-pair) applications
- Selectable receiver sensitivity – Fully restores the received signal after transmission through a cable with attenuation of either 0 to 26 dB, or 0 to 36 dB @ 772 kHz and 0 to 43 dB @ 1024 kHz
- Five Pulse Equalization Settings for T1 short-haul applications
- Four Line Build-Outs for T1 long-haul applications from 0 dB to -22.5 dB
- Transmit/receive performance monitors with Driver Fail Monitor Open and Loss of Signal outputs
- Selectable unipolar or bipolar data I/O and B8ZS/HDB3 encoding/decoding
- Line attenuation indication output in 2.9 dB steps
- QRSS generator/detector for testing or monitoring
- Output short circuit current limit protection
- Local, remote, analog and inband network loopback generation and detection
- Multiple-register serial- or parallel-interface for microprocessor control
- Available in 28-pin DIP, 28-pin PLCC, and 44-pin PQFP packages

LXT360 Block Diagram

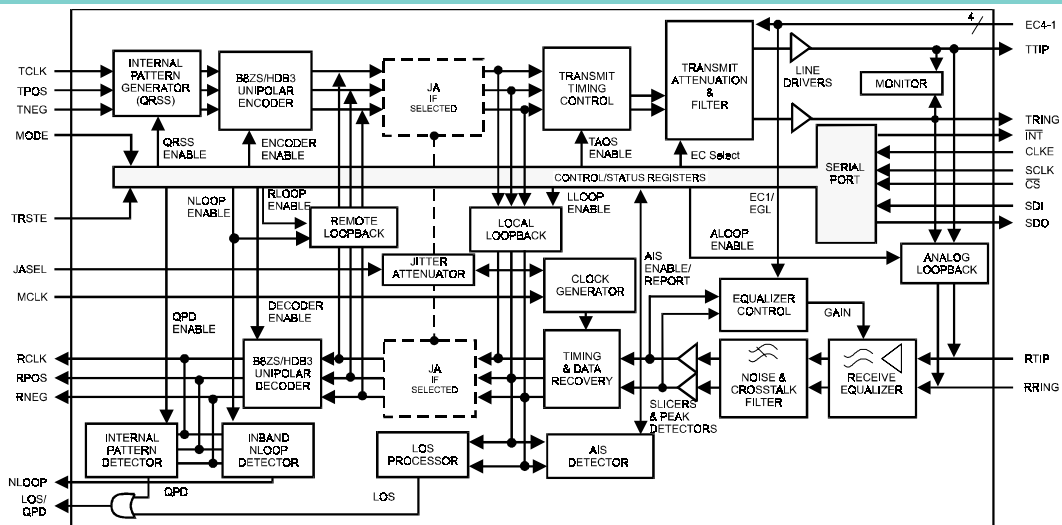

Figure 1: LXT360 Hardware Controlled Bipolar Mode Pin Assignments

Table 1: LXT360 Clock and Data Pin Assignments by Mode¹

Pin # DIP/ PLCC	Pin # QEP	External Data Modes		QRSS Modes

Table 3: LXT360 Hardware Controlled Bipolar Mode Signal Descriptions

Pin # DIP/ PLCC	Pin # QFP ⁴	Symbol	I/O ²	Description
1 ¹	39 ¹	MCLK	DI	Master Clock. Connect to 1.544 MHz for T1 operation; to 2.048 MHz for E1. MCLK input requires an external, independent clock signal to generate internal clocks. Required accuracy is better than ± 32 ppm with a typical duty cycle of 50%. Upon Loss of Signal (LOS), RCLK is derived from MCLK.
2 ¹	41 ¹	TCLK	DI	Transmit Clock. 1.544 MHz or 2.048 MHz clock input. Transceiver samples TPOS and TNEG on the falling edge of TCLK
3 4	42 43	TPOS TNEG	DI	Transmit Data – Positive and Negative. In the Bipolar I/O mode, these pins are the positive and negative sides of a bipolar input pair. Data to be transmitted onto the twisted-pair line is input at these pins. Table 4 describes Unipolar Mode functions.
5 ¹	2	MODE	DI	Mode Select. Connecting MODE Low puts the LXT360 in the Hardware Mode. In Hardware Mode, the serial interface is disabled and hardwired pins are used to control configuration and report status. Connecting MODE to Midrange ³ activates the Hardware Mode and enables the B8ZS/HDB3 encoder/decoder and Unipolar Mode. Connecting MODE High puts the LXT360 in the Host Mode. In the Host Mode, the serial interface controls the LXT360 and displays its status.
6 7	3 4	RNEG RPOS	DO	Receive Data – Negative and Positive. In the Bipolar I/O mode, these pins are the positive and negative sides of a bipolar output pair. Data recovered from the line interface is output on these pins. A signal on RNEG corresponds to receipt of a negative pulse on RTIP/RRING. A signal on RPOS corresponds to receipt of a positive pulse on RTIP/RRING. RNEG/RPOS outputs are Non-Return-to-Zero. Both outputs are stable and valid on the rising edge of RCLK. Refer to Table 4 for Unipolar Mode function descriptions.
8	15	RCLK	DO	Recovered Clock. The clock recovered from the line input signal is output on this pin. Under LOS conditions there is a smooth transition from RCLK signal (derived from the recovered data) to MCLK signal at the RCLK output.
9	7	TRSTE	DI	Tristate. Connecting TRSTE High forces all output pins to a high impedance state. Connecting TRSTE Low sets LXT360 to the Hardware Bipolar Mode. Connecting TRSTE to Midrange ³ enables the Unipolar Mode. (See Table 4 for Unipolar function descriptions.)
10	–	<i>n/c</i>	–	<i>No connection. Leave this pin floating.</i>

1. These pins do not change function as the operating mode changes. Tables 4 through 6 do not describe these pins.
 2. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
 3. Midrange is a voltage level such that $2.3\text{ V} \leq \text{Midrange} \leq 2.7\text{ V}$ or the pin may float.
 4. Pins 1, 6, 8, 11, 12, 14, 17, 22, 23, 26, 28, 30, 33, 34, 40, and 44 are not connected (*n/c*).

Table 3: LXT360 Hardware Controlled Bipolar Mode Signal Descriptions – *continued*

Pin # DIP/ PLCC	Pin # QFP ⁴	Symbol	I/O ²	Description
11	10	JASEL	DI	Jitter Attenuation Select. Selects jitter attenuation location. Connecting JASEL High activates the jitter attenuator in the receive path. Connecting JASEL Low activates the jitter attenuator in the transmit path. Connecting JASEL to Midrange ³ disables JA.
12	13	LOS	DO	Loss of Signal Indicator. In T1 modes, LOS goes High on receipt of 175 consecutive spaces and returns Low when the received signal reaches a mark density of 12.5% (determined by receipt of 16 marks within a sliding window of 128 bits with fewer than 100 consecutive zeros). In E1 modes, LOS goes High on receipt of 32 consecutive spaces, and returns Low when the receiver detects 12.5% mark density (determined by receipt of 4 marks within a sliding window of 32 bits with fewer than 16 consecutive zeros). The transceiver outputs received marks on RPOS and RNEG even when LOS is High.
13 ¹ 16 ¹	15 ¹ 19 ¹	TTIP TRING	AO	Transmit Tip and Ring. Differential Driver Outputs. These outputs are designed to drive a 50 - 200 Ω load. The transformer and line matching resistors should be selected to give the desired pulse height and return loss performance.
14 ¹	16 ¹	TGND		Ground return for the transmit drivers power supply TVCC.
15 ¹	18 ¹	TVCC	DI	+5 VDC Power Supply input for the transmit drivers. TVCC must not vary from VCC by more than ± 0.3 V.
17	20	EC4	DI	Equalization Control 4. Used with EC3-1 (pins 23-25) for pulse equalization and LBO settings.
18 ¹	21 ¹	NLOOP	DO	Network Loopback Detection. If the LXT360 is configured to detect Network Loopback (NLOOP) (by connecting the RLOOP pin to Midrange ³), this pin goes High when an Inband Network Loopback has been activated by the reception of a 00001 pattern for five seconds. NLOOP is reset by reception of 001 for five seconds, or by activation of RLOOP.
19 ¹ 20 ¹	24 ¹ 25 ¹	RTIP RRING	AI	Receive Tip and Ring. The AMI signal received from the line is applied at these pins. A 1:1 transformer is required. Data and clock from the signal applied at these pins are recovered and output on the RPOS/RNEG, and RCLK pins.
21 ¹	27 ¹	VCC		+5 VDC Power Supply for all circuits except the transmit drivers. (Transmit drivers are supplied by TVCC.)
22 ¹	29 ¹	GND		Ground return for power supply VCC.

1. These pins do not change function as the operating mode changes. Tables 4 through 6 do not describe these pins.
 2. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
 3. Midrange is a voltage level such that 2.3 V ≤ Midrange ≤ 2.7 V or the pin may float.
 4. Pins 1, 6, 8, 11, 12, 14, 17, 22, 23, 26, 28, 30, 33, 34, 40, and 44 are not connected (n/c).

Table 3: LXT360 Hardware Controlled Bipolar Mode Signal Descriptions – continued

Pin # DIP/ PLCC	Pin # QFP ⁴	Symbol	I/O ²	Description
23 24 25	31 32 35	EC1 EC2 EC3	DI	Equalization Control 3-1. EC4-1 (including pin 17) define the Pulse Equalization, Line Build Outs and Equalizer Gain Limit settings. See Table 12 for additional details.
26	36	RLOOP	DI	Remote Loopback. When held High, the clock and data inputs from the framer (TPOS/TNEG or TDATA) are ignored and the data received from the twisted-pair line is transmitted back onto the line at the RCLK frequency. During remote loopback, the device ignores the in-line encoders/decoders. Connecting this pin to Midrange enables Network Loopback. See Figure 8.
27	37	LLOOP	DI	Local Loopback. When held High, the data on TPOS and TNEG loops back digitally to RPOS and RNEG outputs (through JA if enabled). Connecting this pin to Midrange ³ enables Analog Loopback (TTIP and TRING looped back to RTIP and RRING). See Figures 5, 6, and 7.
28	38	TAOS	DI	Transmit All Ones. When held High the transmit data inputs are ignored and the LXT360/361 transmits a stream of 1s at the TCLK frequency. (If TCLK is not supplied, MCLK is the transmit clock reference.) TAOS is inhibited during Remote Loopback. Connecting this pin to Midrange enables QRSS pattern generation and detection. See Figure 5, 10, and 11.

1. These pins do not change function as the operating mode changes. Tables 4 through 6 do not describe these pins.
 2. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
 3. Midrange is a voltage level such that $2.3\text{ V} \leq \text{Midrange} \leq 2.7\text{ V}$ or the pin may float.
 4. Pins 1, 6, 8, 11, 12, 14, 17, 22, 23, 26, 28, 30, 33, 34, 40, and 44 are not connected (n/c).

Table 4: LXT360 Hardware Controlled Unipolar Mode Signal Assignments

Pin # DIP/ PLCC	Pin # QFP	Symbol	I/O ¹	Description
3	42	TDATA	DI	Transmit Data. Unipolar input for data to be transmitted onto the twisted-pair line.
4	43	INSBPV	DI	Insert Bipolar Violation. This pin is sampled on the falling edge of TCLK to control Bipolar Violation Insertions in the transmit data stream. A Low-to-High transition is required to insert subsequent BPVs.
6	3	BPV	DO	Bipolar Violation. BPV goes High to report receipt of a bipolar violation from the line. This is an NRZ output, valid on the rising edge of RCLK.
7	4	RDATA	DO	Receive Data. RDATA is a unipolar NRZ output of data recovered from the line interface. In Hardware Mode RDATA is stable and valid on the rising edge of RCLK.

1. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.

Table 5: LXT360 Hardware Controlled QRSS Unipolar Mode Signal Assignments

Pin # DIP/ PLCC	Pin # QFP	Symbol	I/O ¹	Description
3	42	INSLER	DI	Insert Logic Error. When this pin goes from Low to High, the transceiver inserts a logic error into the transmitted QRSS data pattern. The error follows the data flow in whatever loopback mode is in effect. The LXT360 samples this pin on the falling edge of TCLK (or MCLK, if TCLK is not present).
4	43	INSBPV	DI	Insert Bipolar Violation. When this pin goes from Low to High, the transceiver inserts a bipolar violation error into the transmitted QRSS data pattern. A subsequent insertion requires another Low to High transition. The LXT360 samples this pin on the falling edge of TCLK (or MCLK, if TCLK is not present).
6	3	BPV ³	DO	Bipolar Violation. BPV goes High to report receipt of a bipolar violation from the twisted-pair line. This is an NRZ output, valid on the rising edge of RCLK.
7	4	RDATA ³	AO	Received Data. RDATA is a unipolar NRZ output of data recovered from the line interface. In hardware Mode, RDATA is stable and valid on the rising edge of RCLK.
12	13	LOS/ QPD	DO	Loss of Signal/QRSS Pattern Detect. This pin acts as a QPD indicator as well as LOS indicator. The QRSS Pattern synchronization criterion is fewer than four errors in 128 bits. In this mode, as long as the transceiver does not detect a QRSS pattern QPD stays High. As soon as the device does detect a QRSS pattern, the pin goes Low; any bit errors cause QPD to go High for half a clock cycle. This output can trigger an external error counter. An LOS condition will also make this pin go High. See Figure 11.
28	38	QRSS	DI	QRSS. Setting this pin to Midrange ² , enables QRSS pattern generation and detection. The transceiver transmits the QRSS pattern at the TCLK rate (or MCLK, if TCLK is not present).

1. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
2. Midrange is a voltage level such that $2.3\text{ V} \leq \text{Midrange} \leq 2.7\text{ V}$ or the pin may float.
3. In QRSS Bipolar Mode, pins 6 and 7 for NE/PE pkg. or 3 and 4 for QE pkg. act as RNEG and RPOS, respectively.

Table 6: LXT360 Host Controlled Bipolar Mode Signal Assignments^{1,2}

Pin # DIP/ PLCC	Pin # QFP ⁴	Symbol	I/O ³	Description
5	2	MODE	DI	Mode. Connecting MODE High puts the LXT360 in Host Mode. In Host Mode, the serial interface controls the LXT360 and displays its states.
6 7	3 4	RNEG RPOS	DO	Received Data—Negative and Positive. In the Bipolar I/O Mode, these pins are the negative and positive sides of a bipolar output pair. The transceiver outputs the data recovered from the line interface on these pins. A signal on RNEG corresponds to receipt of a negative pulse on RTIP/RRING. A signal on RPOS corresponds to receipt of a positive signal on RTIP/RRING. RNEG/RPOS outputs are Non-Return-to-Zero (NRZ). CLKE determine the clock edge at which these outputs are stable and valid. See Figure 19.

1. For pins not described in this table, see Table 3. Pin out for data pins in Unipolar and QRSS Modes remains the same as in Tables 4 and 5. In Host Mode, the control pins (23-28) change as shown in Table 6.
2. In QRSS Bipolar Mode, pins 6 and 7 seven act as RNEG and RPOS, respectively.
3. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
4. Pins 1, 6, 8, 11, 12, 14, 17, 22, 23, 26, 28, 30, 33, 34, 40, and 44 are not connected (*n/c*).

Table 6: LXT360 Host Controlled Bipolar Mode Signal Assignments— *continued*^{1,2}

Pin # DIP/ PLCC	Pin # QFP ⁴	Symbol	I/O ³	Description
9	7	TRSTE	DI	Tristate. Connecting TRSTE High forces all output pins to high-impedance state. Connect this pin Low for normal operation.
10	–	<i>n/c</i>	–	<i>Not connected.</i>
11	10	<i>n/c</i>	–	<i>Connect Low.</i>
17	20	<i>n/c</i>	–	<i>Connect Low.</i>
18	21	NLOOP	DO	Network Loopback. This pin goes High when an Inband Network Loopback has been activated.
23	31	INT	DO	Interrupt (Active Low–Maskable). INT goes Low to flag the host when any of the LOS, NLOOP, AIS, QRSS, DFMS or DFMO changes state or when there is an Elastic Store overflow or underflow. INT is an open drain output which requires a connection to power supply VCC through a resistor. Reset INT by writing a one to the respective bit in the Interrupt Clear Register.
24	32	SDI	DI	Serial Data Input. Input port for the 16-bit serial address/command and data word. LXT360 samples SDI on the rising edge of SCLK. See Figures 20 and 21.
25	35	SDO	DO	Serial Data Output. If CLKE is High, SDO is valid on the rising edge of SCLK. If CLKE is Low, SDO is valid on the falling edge of SCLK. This pin goes to a high-impedance state when the serial port is being written to or when \overline{CS} is High. See Figure 21.
26	36	\overline{CS}	DI	Chip Select (Active Low). This input is used to access the serial interface. For each read or write operation, \overline{CS} must transition from High to Low, and remain Low.
27	37	SCLK	DI	Serial Clock. This clock is used to write data to or read data from the serial interface registers. The clock frequency can be any rate up to 2.048 MHz.
28	38	CLKE	DI	Clock Edge. Setting CLKE High causes RPOS and RNEG to be valid on the falling edge of RCLK, with SDO valid on the rising edge of SCLK. Setting CLKE Low makes RPOS and RNEG valid on the rising edge of RCLK and SDO valid on the falling edge of SCLK.

1. For pins not described in this table, see Table 3. Pin out for data pins in Unipolar and QRSS Modes remains the same as in Tables 4 and 5. In Host Mode, the control pins (23-28) change as shown in Table 6.
 2. In QRSS Bipolar Mode, pins 6 and 7 seven act as RNEG and RPOS, respectively.
 3. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
 4. Pins 1, 6, 8, 11, 12, 14, 17, 22, 23, 26, 28, 30, 33, 34, 40, and 44 are not connected (*n/c*).

24	32	AD1		--	--	--	

Table 9: LXT361 Bipolar Mode Signal Assignments

Pin # DIP/ PLCC	Pin # QFP ²	Symbol	I/O ¹	Description
1	39	MCLK	DI	Master Clock. Connect to 1.544 MHz for T1 operation; to 2.048 MHz for E1. MCLK requires an external, independent input to generate internal clocks. Required accuracy is ± 32 ppm with a typical duty cycle of 50%. Upon Loss of Signal (LOS), the transceiver derives RCLK from MCLK.
2	41	TCLK	DI	Transmit Clock. 1.544 MHz or 2.048 MHz bit rate clock input. The transceiver samples TPOS and TNEG on the falling edge of TCLK
3 4	42 43	TPOS TNEG	DI	Transmit Data – Positive and Negative. In the Bipolar I/O Mode, these pins are the positive and negative sides of a bipolar input pair. Data for transmission onto the twisted-pair line is input at these pins.
5	2	ALE AS	DI	Address Latch Enable/Address Strobe (Active Low). Connects to Intel (ALE) or Motorola (AS) signal. On Motorola bus, this signal is Active Low. Leaving this pin floating forces all output pins into a high impedance state.
6 7	3 4	RNEG RPOS	DO	Receive Data – Negative and Positive. In the Bipolar I/O mode, these pins are the positive and negative sides of a bipolar output pair. Data recovered from the line interface is output on these pins. A signal on RNEG corresponds to receipt of a negative pulse on RTIP/RRING. A signal on RPOS corresponds to receipt of a positive pulse on RTIP/RRING. RNEG/RPOS outputs are Non-Return-to Zero. Both outputs are stable and valid on the rising edge of RCLK. Refer to Table 10 for Unipolar Mode function descriptions.
8	5	RCLK	DO	Recovered Clock. The output on this pin is the clock recovered from the line input signal. Under LOS conditions there is a smooth transition from RCLK to MCLK output.
9	7	RD DS	DI	Read (Active Low)/Data Strobe (Active Low). On an Intel bus, this signal, Read, goes Low to command a read operation. On a Motorola bus, this signal, Data Strobe, goes Low when data is being driven on the address/data bus. Data is valid on the rising edge of DS.
10 11	9 10	AD6 AD7	DI/ O DI/ O	Address/Data bus lines 6 and 7. Used with pins 24-28 as the address/data bus.
12	13	WR R/W	DI	
13 16	15 19	TTIP TRING	AO	Transmit Tip and Ring. Differential Driver Outputs. The design load for these outputs is 50 - 200 Ω . Select the transformer and line matching resistors to give the desired pulse height.

1. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
2. Pins 1, 6, 8, 11, 12, 14, 17, 22, 23, 26, 28, 30, 33, 34, 40, and 44 are not connected (n/c).

Table 9: LXT361 Bipolar Mode Signal Assignments – continued

Pin # DIP/ PLCC	Pin # QFP ²	Symbol	I/O ¹	Description
14	16	TGND	–	Ground return for the transmit drivers power supply TVCC.
15	18	TVCC	–	+5 VDC Power Supply input for the transmit drivers. TVCC must not vary from VCC by more than ± 0.3 V.
17	20	\overline{CS}	DI	Chip Select (Active Low). For each read or write on the Address/Data bus, this pin must go Low during the operation. See Figures 22 and 23 for timing requirements. In the case of a single processor controlling several chips, this is the line it uses to command a specific transceiver.
18	21	INT	DO	Interrupt (Active Low). This pin goes Low to signal an interrupt on the chip. To identify the specific interrupt, read the Performance Status Register. To clear or mask an interrupt, write a one to the appropriate bit in the Clear Interrupt Register.
19 20	24 25	RTIP RRING	AI	Receive Tip and Ring . The AMI signal received from the line is applied at these pins. A 1:1 transformer is required. Data and clock from the signal applied at these pins are recovered and output on the RPOS/RNEG, and RCLK pins.
21	27	VCC	–	+5 VDC Power Supply for all circuits except the transmit drivers. (Transmit drivers are supplied by TVCC.)
22	29	GND	–	Ground return for power supply VCC.
23 24 25 26 27 28	31 32 35 36 37 38	AD0 AD1 AD2 AD3 AD4 AD5	DI/ O	Address/Data Lines 0-5 . (Also pins 10, 11–AD6 and 7) Conform to Intel and Motorola Address/Data bus specifications.

1. I/O column entries: DI = Digital Input; DO = Digital Output; DI/O = Digital Input/Output; AI = Analog Input; AO = Analog Output.
2. Pins 1, 6, 8, 11, 12, 14, 17, 22, 23, 26, 28, 30, 33, 34, 40, and 44 are not connected (n/c).

Table 10: LXT361 Unipolar Mode Signal Assignments¹

Pin # DIP/ PLCC	Pin # QFP	Symbol	I/O ²	Description
3	42	TDATA	DI	Transmit Data . Unipolar data for transmission onto the twisted-pair line.
4	43	INBPV	DI	Insert Bipolar Violation . Controls bipolar violation insertions, requires Low-to-High transition to insert each violation, the LXT361 samples the signal on the falling edge of TCLK.
6	3	BPV	DO	Bipolar Violation . BPV goes High on receipt of a bipolar violation from twisted-pair line. This is an NRZ output, valid on the rising edge of RCLK.
7	4	RDATA	DO	Received Data . RDATA is an NRZ output of the data recovered from the line interface. RDATA is valid on the rising edge of RCLK.

1. For the descriptions of pins not identified in this table, see Table 9: LXT361 Bipolar Mode Signal Assignments.
2. I/O column entries DI = digital input; DO = digital output, DI/O = digital input and output; AI = analog input, AO = analog output.

Table 11: LXT361 QRSS Unipolar Mode Signal Assignments^{1,2}

Pin # DIP/ PLCC	Pin # QFP	Symbol	I/O ³	Description
3	42	INSLER	DI	Insert Logic Error. When this pin goes from Low to High, the transceiver inserts a logic error into the transmitted QRSS data pattern. The error follows the data flow in whatever loopback mode is in effect. The LXT361 samples this pin on the falling edge of TCLK (or MCLK, if TCLK is not present).
4	43	INSBPV	DI	Insert Bipolar Violation. When this pin goes from Low to High, the transceiver inserts a bipolar violation error into the transmitted QRSS data pattern. A subsequent insertion requires another Low to High transition. The LXT361 samples this pin on the falling edge of TCLK (or MCLK, if TCLK is not present).
6	3	BPV	DO	Bipolar Violation. BPV goes High on receipt of a bipolar violation from twisted-pair line. This is an NRZ output, valid on the rising edge of SCLK.
7	4	RDATA	DO	Received Data. RDATA is an NRZ output of the data recovered from the line interface. RDATA is valid on the rising edge of RCLK.

1. For the descriptions of pins not identified in this table, see Table 9.
2. In QRSS Bipolar Mode, pins 6 and 7 for NE/PE pkg. or 3 and 4 for QE pkg. act as RNEG and RPOS, respectively.
3. I/O column entries DI = digital input; DO = digital output, DI/O = digital input and output; AI = analog input, AO = analog output.

Figure 3: LXT361 Integrated T1/E1 Transceiver Block Diagram

FUNCTIONAL DESCRIPTION

The LXT360 and LXT361 are fully integrated, PCM transceivers for long- or short-haul, 1.544 Mbps (T1) or 2.048 Mbps (E1) applications allowing full-duplex transmission of digital data over existing twisted-pair installations. They interface with two twisted-pair lines (one pair each for transmit and receive) through standard pulse transformers and appropriate resistors.

The figure at the front of this Data Sheet shows a block diagram of the LXT360. Control of this chip is via either a serial microprocessor port or, in Hardware Mode, via individual pin settings. Figure 3 is a block diagram of the LXT361. The LXT361 has a parallel port for microprocessor control. Both transceivers provide a high-precision, crystal-less jitter attenuator. The user may place it in the transmit or receive path, or bypass it completely.

The transceivers meet or exceed FCC and AT&T specifications for CSU and DSX-1 applications, as well as ANSI T1/E1, and ITU and ETSI requirements for E1 ISDN PRI applications.

INITIALIZATION

During power up, the transceiver remains static until the power supply reaches approximately 3 V. On crossing this threshold, the device begins a 32 ms reset cycle to calibrate the Phase Lock Loops (PLL). The transceiver uses a reference clock to calibrate the PLL; the transmitter reference is TCLK, and the receiver reference clock is MCLK. MCLK is mandatory for chip operation.

Reset Operation

Reset clears and sets all registers to 0 and resets the status and state machines for the LOS, AIS, NLOOP, and QRSS blocks. In Hardware Mode, holding pins RLOOP, LLOOP and TAOS High for at least one clock cycle resets the device. Writing a 1 to the bit CR2.RESET commands reset in Host Mode. Allow 32 ms for the device to settle after removing all reset conditions.

TRANSMITTER

Digital Data Interface

Input data for transmission onto the line is clocked serially into the device at the TCLK rate. TPOS and TNEG are the bipolar data inputs. TDATA accepts unipolar data. (Setting the TRSTE pin to Midrange enables Hardware Unipolar Mode.)

Input data may pass through either the Jitter Attenuator or B8ZS/HDB3 encoder or both. Bit CR1.ENCENB = 1 enables B8ZS/HDB3 encoding in Host Mode. In Hardware Mode, connecting the MODE pin to Midrange selects zero suppression coding. With zero suppression enabled, the ECx inputs (see Table 12) determine the coding scheme (B8ZS for T1 or HDB3 for E1 mode). To select the HDB3 scheme, set EC4-1 to 1000, 1001 or 1010. Other ECx settings select the B8ZS option. The transmit clock (TCLK) supplies input synchronization. The Test Specifications section defines the transmit timing requirements for TCLK and the Master Clock (MCLK).

Short Circuit Limit

The transmitter includes a short circuit limiter. This limits the current sourced into a low impedance load. It automatically resets when the load current drops below the limit. The current is determined by the interface circuitry (total resistance on transmit side).

In Host Mode, the Performance Status Register flags open circuits in bit PSR.DFMO. A transition on DFMO will provide an interrupt and the transition sets bit TSR.DFMO = 1. Writing a 1 in bit ICR.CDFMO clears the interrupt; leaving a 1 in the bit masks that interrupt.

Output Drivers

The transceivers transmit data as a 50% line code as shown in Figure 4. Activating the line driver only during a mark reduces power consumption. The output driver is disabled during transmission of a space. Biasing of the transmit DC level is on-chip.

Figure 4: 50% Duty Cycle Coding Diagram

Idle Mode

Transmit Idle Mode is a normal operational mode (as opposed to modes) which allows multiple transceivers to be connected to a single line for redundant applications. TTIP and TRING remain in a high impedance state when TCLK is not present. Remote or Dual Loopback, TAOS or any internal transmit patterns temporarily disable the high impedance state as will detection of Network Loop Up code in the receive direction.

Pulse Shape

The Equalizer Control inputs (EC4-1) determine the transmitted pulse shape as in Table 12. In Host Mode, the I/O port controls the ECx values. For the LXT360 in Hardware Mode, four individual pins provide the ECx inputs.

Shaped pulses meeting the various T1, DS1, DSX-1 and E1 specifications are applied to the AMI line driver for transmission onto the line at TTIP and TRING. The transceivers produce DSX-1 pulses for short-haul T1 applications (settings from 0 dB to +3.0 dB), DS1 pulses for long-haul T1 applications (settings from 0 dB to -22.5 dB), and a G.703 pulse for E1 applications. Refer to the Test Specifications section for pulse mask specifications.

RECEIVER

A 1:1 transformer provides the interface to the twisted-pair line. Recovered data is output at RPOS/RNEG (RDATA in Unipolar Mode), and the recovered clock is output at RCLK. The Test Specifications section shows receiver timing.

Receiver Equalizer

The receive equalizer processes the signal received at RTIP and RRING. The equalizer gain is up to 43 dB in E1 long-haul applications. In T1 long-haul applications, the equalizer control (ECx) input pins or register bits determine the maximum gain applied at the equalizer. With EC1 Low, up to 36 dB of gain may be applied. When EC1 is High, 26 dB is the gain limit to provide an increased noise margin in shorter loop operations.

The receiver can accurately recover signals with up to 36 dB of cable attenuation (from 2.4 V) for T1 and up to 43 dB of cable attenuation (from 2.7 V) for E1 operation.

Data Recovery

The transceiver filters the equalized signal and applies it to the peak detector and data slicers. The peak detector samples the inputs and determines the maximum value of

the received signal. The data slicers are set at 50% of the peak value to ensure optimum signal-to-noise performance.

After processing through the data slicers, the received signal goes to the data and timing recovery section, then to the B8ZS/HDB3 decoder (if selected) and to the receive monitor. The data and timing recovery circuits provide input jitter tolerance significantly better than required by AT&T Pub 62411 and ITU G.823. See the Test Specifications section.

Digital Data Interface

In either Host or Hardware Control Mode the recovered data goes to the Loss of Signal (LOS) Monitor. In Host Control Mode, it also goes through the Alarm Indication Signal (AIS, Blue Alarm) Monitor. The jitter attenuator circuit may be enabled or disabled in the receive data path or the transmit path. Received data may go through either the B8ZS or HDB3 decoder or neither. Finally, the device may send the digital data to the framer as either unipolar or bipolar data.

When transmitting unipolar data to the framer, the device reports receiving bipolar violations by driving the BPV pin High. During E1 operation in Host Control Mode, the device can report HDB3 code violations and Zero Substitution Violations on the BPV pin. The diagnostics section explains these options in more detail.

Receiver Monitor Mode

The receive equalizer of the LXT360/361 can be used in Monitor Mode applications. Monitor Mode applications are those requiring a resistive attenuation of the signal in addition to a small amount of cable attenuation (less than 6 dB). Setting bit CR3.EQZMON = 1 configures the device to work in its Monitor Mode. The device must be in its long-haul receiver mode (set bits CR1.ECx = 0xx0 or 1001 or 1010) for Monitor Mode. This feature is not available in the LXT360 Hardware Mode.

With the device in Monitor Mode, the receive equalizer handles signals attenuated resistively by 20 to 30 dB, along with 0 to 6 dB of cable attenuation for both E1 and T1 applications.

JITTER ATTENUATION

A Jitter Attenuation Loop (JAL) with an Elastic Store (ES) provides jitter attenuation as shown in the Test Specifications section. The JAL requires no special circuitry, such as an external quartz crystal or high-frequency clock (higher than the line rate). Its timing reference is the master clock, MCLK.

LXT360/361 Integrated T1/E1 LH/SH Transceivers

In Hardware Control Mode the ES is a 32 x 2-bit register. Setting the JASEL pin High places the JA circuitry in the received data path; setting JASEL Low places the JA in the transmit data path; tying it to Midrange disables the JA.

In Host Mode, bit CR1.JASEL0 enables or disables the JA circuit. With bit CR1.JASEL0 = 1, bit CR1.JASEL1 controls the JA circuit placement (see Table 17). The ES can be either a 32 x 2-bit or 64 x 2-bit register depending on the value of bit CR3.ES64 (see Table 19.)

The device clocks data into the ES using either TCLK or Receiver Recovered Clock depending on whether the JA circuitry is in the transmit or receive data path, respectively. Data is shifted out of the elastic store using the dejit-

tered clock from the JAL. When the FIFO is within two bits of overflowing or underflowing, the ES adjusts the output clock by $\frac{1}{8}$ of a bit period. The ES produces an average delay of 16 bits (or 32 bits, with the 64-bit ES option selected in Host Control Mode) in the associated data path. When the Jitter Attenuator is in the receive path, the output RCLK transitions smoothly to MCLK in the event of an LOS condition.

The Transition Status Register bits TSR.ESOVF and TSR.ESUNF indicate an overflow or underflow, respectively, in the ES. These are sticky bits: once set to 1, they remain set until the host reads the register. The ES can also provide a maskable interrupt on either overflow or underflow.

Table 12: Equalizer Control Input Settings

EC4	EC3	EC2	EC1 ¹	Function	Pulse	Cable	Gain	Coding ²
0	0	0	0	T1 Long Haul	0.0 dB pulse	100 Ω TP	36 dB	B8ZS
0	0	1	0	T1 Long Haul	-7.5 dB pulse	100 Ω TP	36 dB	B8ZS

DIAGNOSTIC MODE OPERATION

LXT360/361 offers multiple diagnostic modes as shown in Table 13. In Hardware Mode, the diagnostic modes are selected by a combination of pin settings. In Host Mode, the diagnostic modes are selected by writing appropriate bits in the Diagnostic Control Register.

Table 13: Diagnostic Mode Availability

Diagnostic Mode	Availability ¹		Host Mode ² Maskable
	H/W	Host	
Loopback Modes			
Local Loopback (LLOOP)	Yes	Yes	No
Analog Loopback (ALOOP)	Yes	Yes	No
Remote Loopback (RLOOP)	Yes	Yes	No
In-band Network Loopback (NLOOP)	Yes	Yes	Yes
Dual Loopback (DLOOP)	Yes	Yes	No
Internal Data Pattern Generation and Detection			
Transmit All Ones (TAOS)	Yes	Yes	No
Quasi-Random Signal Source (QRSS)	Yes	Yes	Yes
In-band loop up/down code generator	No	Yes	No
Error Insertion and Detection			
Bipolar Violation Insertion (INSBPV)	Yes	Yes	No
Logic Error Insertion (INSLER)	Yes	Yes	No
Bipolar Violation Detection (BPV)	Yes	Yes	No
Logic Error Detection, QRSS (QPD)	Yes	Yes	No
HDB3 Code Violation Detection (CODEV)	No	Yes	No
HDB3 Zero violation Detection (ZEROV)	No	Yes	No
Alarm Condition Monitoring			
Receive Loss of Signal (LOS) monitoring	Yes	Yes	Yes
Receive Alarm Indication Signal (AIS) monitoring	No	Yes	Yes
Transmit Driver Failure Monitoring—Open (DFMO)	No	Yes	Yes
Elastic store overflow and underflow monitoring	No	Yes	Yes
Other Diagnostic Reports			
Receive Line Attenuation Indicator (LATN)	No	Yes	No
Built-In Self Test (BIST)	No	Yes	Yes
<p>1. In Hardware Control Mode, a combination of pin settings selects the Diagnostics Modes; in Host Control Mode, writing appropriate bits in the Control Registers selects the Diagnostic Modes.</p> <p>2. Host Control Mode allows interrupt masking by writing a “1” to the corresponding bit in the Interrupt Clear Register. Hardware Control Mode has no interrupt masking feature.</p>			

LOOPBACK MODES

NOTE

Hardware Mode pins discussed in this section refer to the LXT360 only.

Local Loopback

See Figures 5 and 6. In Hardware Mode, Local Loopback (LLOOP) is selected by tying LLOOP High; in Host Mode, by setting CR2.ELLOOP to 1. LLOOP inhibits the receiver circuits. The transmit clock and data inputs (TCLK and TPOS/TNEG or TDATA) loop back through the jitter attenuator (if enabled) and show up at RCLK and RPOS/RNEG or RDATA. (During LLOOP, the JASEL input is strictly an Enable/Disable control; it does not affect the placement of the JAL. If JA is enabled, it is active in the loopback circuit. If JA is bypassed, it is not active in the loopback circuit.)

The transmitter circuits are unaffected by LLOOP. LXT360/361 transmits the TPOS/TNEG or TDATA inputs (or a stream of 1s if TAOS is asserted) normally. When used in this mode, the transceiver can function as a stand-alone jitter attenuator.

Figure 5: TAOS with LLOOP (JA Selected)

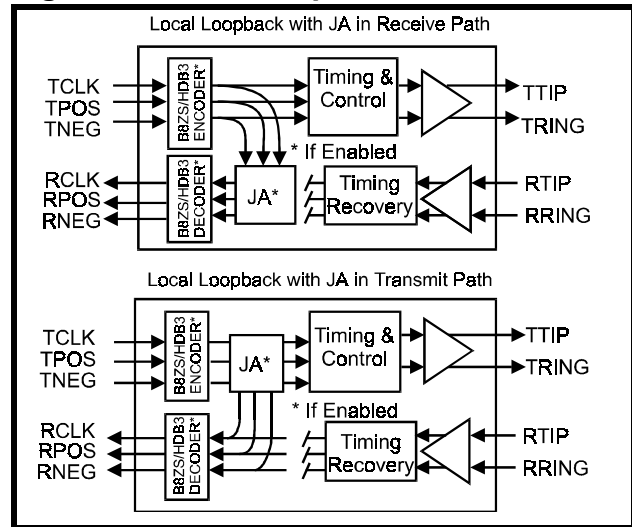

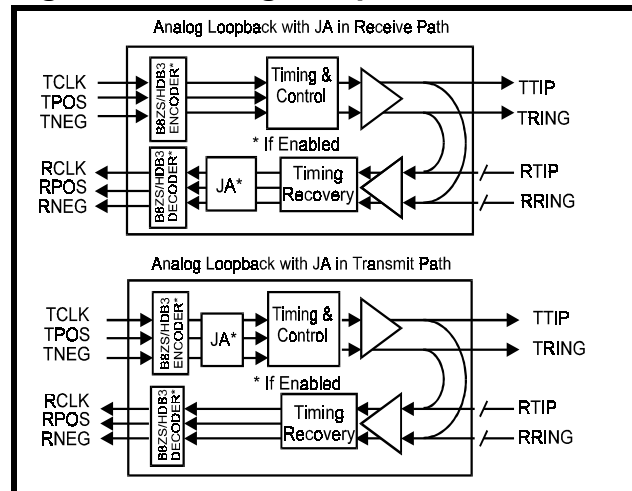

Figure 6: Local Loopback (JA Selected)

Analog Loopback

See Figure 7. Analog Loopback (ALOOP) exercises the maximum number of functional blocks. ALOOP operation disconnects the RTIP/RRING inputs from the line and routes the transmit outputs back into the receive inputs. This tests the encoders/decoders, jitter attenuator, transmitter, receiver and timing recovery sections. In Hardware Mode, tying pin 27 to Midrange commands Analog Loopback; in Host Mode, writing a 1 to bit CR2.EALOOP enables the function. The ALOOP function overrides all other loopback modes.

Figure 7: Analog Loopback (JA Selected)

Remote Loopback

See Figure 8. In Remote Loopback (RLOOP) mode, the device ignores the transmit data and clock inputs (TCLK and TPOS/TNEG or TDATA), and bypasses the in-line encoders/decoders. The RPOS/RNEG or RDATA outputs loop back through the transmit circuits to TTIP and TRING at the RCLK frequency. The RLOOP command does not affect the receiver circuits which continue to output the RCLK and RPOS/RNEG or RDATA signals received from the twisted-pair line. In Host Mode, command RLOOP by writing a 1 to bit CR2.ERLOOP. In Hardware Mode, RLOOP is commanded by setting pin 26 High.

Network Loopback

Network Loopback (NLOOP) can be initiated only when the Network Loopback detect function is enabled. In Host Mode, writing a 1 to CR2.ENLOOP enables NLOOP detection. In Hardware Mode, setting RLOOP to Midrange enables Network Loopback detection.

With NLOOP detection enabled, the receiver looks for the NLOOP data patterns (00001 = enable, 001 = disable) in the input data stream. When the receiver detects an NLOOP enable data pattern repeated for a minimum of five seconds, the device enables RLOOP. The device responds to both framed and unframed NLOOP patterns. Once NLOOP detection is enabled at the chip and activated by the appropriate data pattern, it is identical to Remote Loopback (RLOOP). NLOOP is disabled by receiving the 001 pattern for five seconds, or by activating RLOOP or ALOOP, or by disabling NLOOP detection. The device goes into Dual Loopback Mode (DLOOP) in the case where it detects both the NLOOP and LLOOP functions.

Dual Loopback

See Figure 9. To select Dual Loopback (DLOOP), set both RLOOP and LLOOP High in Hardware Mode or set bits CR2.ERLOOP and CR2.ELLOOP to 1 in Host Mode. In DLOOP mode, the transmit clock and data inputs (TCLK and TPOS/TNEG or TDATA) loop back through the Jitter Attenuator (unless disabled) to RCLK and RPOS/RNEG or RDATA. The data and clock recovered from the twisted-pair line loop back through the transmit circuits to TTIP and TRING without jitter attenuation.

Figure 8: Remote Loopback (JA Selected)

Figure 9: Dual Loopback

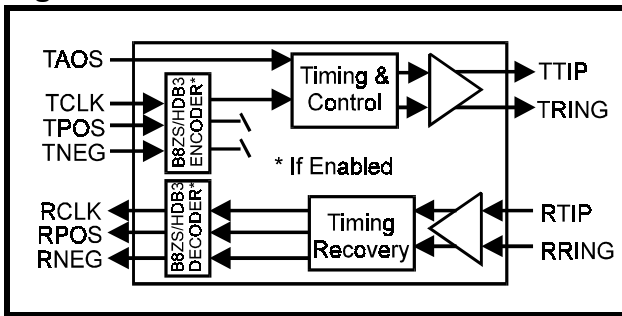

INTERNAL PATTERN GENERATION AND DETECTION

Transmit All Ones

See Figure 10. In Transmit All Ones (TAOS) Mode the transceiver ignores the TPOS and TNEG inputs and transmits a continuous stream of 1s at the TCLK frequency. (With no TCLK, the TAOS output clock is MCLK.) This can be used as the Alarm Indication Signal (AIS—also called the Blue Alarm). In Host Mode, TAOS is commanded by writing a 1 to bit CR2.ETAOS. In Hardware Mode setting pin 28 High does so. Both TAOS and Local Loopback can occur simultaneously as shown in Figure 5, but Remote Loopback inhibits TAOS. When both TAOS and LLOOP are active, TCLK and TPOS/TNEG loop back to RCLK and RPOS/RNEG through the jitter attenuator (if enabled), and an all ones pattern goes to TTIP/TRING.

Figure 10: TAOS Data Path

Quasi-Random Signal Source (QRSS)

See Figure 11. For T1 operation, the Quasi-Random Signal Source (QRSS) is a $2^{20}-1$ pseudo-random bit sequence (PRBS) with no more than 14 consecutive zeros. For E1 operation, QRSS is $2^{15}-1$ PRBS with inverted output.

Both Hardware and Host Modes allow QRSS Mode. The QRSS pattern is normally locked to TCLK; but if there is no TCLK, MCLK is the clock source. Bellcore Pub 62411 defines the T1 QRSS transmit format and ITU G.703 defines the E1 format.

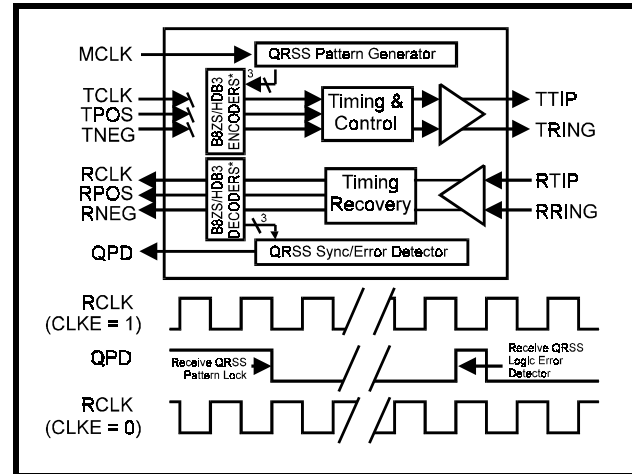

Connecting TAOS (pin 28) Midrange enables QRSS transmission in Hardware Mode. In Host Mode, setting bits CR2.EPAT0 = 0 and CR2.EPAT1=1 enables this function.

With QRSS transmission enabled, it is possible to insert a logic error into the transmit data stream by causing a Low-to-High transition on INSLER (pin 3). However, if no logic or bit errors are to be inserted into the QRSS pattern, INSLER must remain Low. Logic Error insertion waits until the next bit if the current bit is “jammed”.

(When there are more than 14 consecutive 0s, the output is jammed to a 1.)

Furthermore a bipolar violation in the QRSS pattern is possible by causing a Low-to-High transition on INSBPV (pin 4) without regard to whether the device is in bipolar or unipolar operating mode.

Figure 11: QRSS Mode

Choosing QRSS Mode also enables the QRSS Pattern Detection (QPD) in the receive path. The QRSS pattern is synchronized when there are fewer than four errors in 128 bits. After achieving synchronization the device drives QPD (pin 12) Low (QPD output is available on LXT360 only). The LXT361 does not support bit error detection in QRSS Mode. In the LXT360 QRSS Mode, any subsequent bit error in the QRSS pattern causes QPD to go High for half an RCLK clock cycle (the precise relationship to RCLK depends on the value of CLKE—when CLKE is Low, QPD goes High while RCLK is High; if CLKE is High, QPD goes High while RCLK is Low). This signal edge can serve as a trigger for an external bit-error counter. An LOS condition or a loss of QRSS synchronization will cause this output to go High continuously. In this case, and with either Unipolar Mode or the encoders/decoders enabled, the BPV pin indicates BPVs, CODEVs or ZEROVs as chosen.

Host Mode offers an additional interrupt to indicate that QRSS detection and synchronization have occurred, or that synchronization is lost. This interrupt is available when bit ICR.CQRSS = 0. If the QPD signal triggers a bit error counter, the interrupt could start or reset the counter.

Also in Host Mode, the PSR.QRSS bit provides an indication of the QRSS pattern synchronization. This bit goes Low with no QRSS pattern detected (*i.e.*, when there are more than four errors in 128 bits). The TQRSS bit in the Transition Status Register indicates that QRSS status has changed since the last QRSS Interrupt Clear command.

In-Band Network Loop Up or Down Code Generator

In Host Mode, LXT360/361 can transmit in-band Network Loop Up or Loop Down code. The Loop Up code is 00001; Loop Down code is 001. A Loop Up code transmission occurs when Control Register #2 bits EPAT0 = 1 and EPAT1 = 0. A Loop Down code transmission requires that both EPAT0 and EPAT1 = 1.

With this mode enabled, logic errors and bipolar violations can be inserted into the transmit data stream. Inserting a logic error requires a Low-to-High transition in INSLER (pin 3). (If there are no logic or bit errors to insert, INSLER must remain Low.) Inserting a bipolar violation requires a Low-to-High transition on INSBPV (pin 4), independent of Unipolar or Bipolar operation.

ERROR INSERTION AND DETECTION

Bipolar Violation Insertion (*INSBPV*)

In Unipolar Mode, both Hardware and Host Modes provide for Bipolar Violation Insertion (INSBPV). Choosing Unipolar Mode configures pin 4 as INSBPV. Bipolar violation insertion requires a Low-to-High transition on INSBPV. Sampling occurs on the falling edge of TCLK. When INSBPV goes High a BPV is inserted on the next available mark except in the four following situations:

- Zero suppression (HDB3 or B8ZS) is not violated
- If LLOOP and TAOS are both active, the BPV is looped back to RNEG/BPV indicator and the line driver transmits all ones with no violation.
- BPV insertion is disabled with RLOOP (remote loop-back) active.
- BPV insertion is disabled with NLOOP asserted (pin 10 High).

With the LXT360/361 configured to transmit internally generated data patterns (QRSS or NLOOP), a BPV can be inserted on the transmit pattern independent of whether the device is in the unipolar or bipolar mode of operation.

LOGIC ERROR INSERTION (*INSLER*)

When configured to transmit internally generated data patterns (QRSS or NLOOP Up/Down codes), the device can insert a logic error on the transmit data pattern when there is a Low-to-High transition on INSLER. In QRSS Mode, there is no logic error insertion on a jammed bit (a bit forced to one to suppress transmission of more than 14 consecutive zeros). The transceiver treats data patterns the same way it treats data applied to TPOS/TNEG, so the inserted logic error will follow the data flow path as defined by the loopback mode in effect.

Logic Error Detection (*QPD*) (*LXT360 Only*)

After receiving pattern synchronization when configured in the QRSS Mode, LXT360 reports logic errors on QPD (pin 12). To indicate a logic error, this pin goes High for half an RCLK cycle (during the High period of RCLK if CLKE is Low but during the Low RCLK period if CLKE is High). To tally logic errors, connect an error counter to QPD. A continuous logic one on this pin indicates loss of either the QRSS pattern lock or LOS condition. The QRSS section has additional details on QRSS pattern lock criteria.

Bipolar Violation Detection (*BPV*)

With the internal encoders/decoders enabled or when configured in Unipolar Mode, the LXT360/361 reports received Bipolar Violations at BPV (pin 6). The pin goes High for a full clock cycle to indicate receipt of a BPV. However, if the encoders/decoders are enabled, LXT360/361 does not report bipolar violations due to the line coding scheme.

HDB3 Code Violation Detection (*CODEV*)

LXT360/361 can detect HDB3 code violations in Host Mode with HDB3 encoders enabled. This requires CR1.ENCENB = 1 and CR1.EC4-1 = 100x or 1010, which establishes E1 operation. To enable CODEV, set bit CR4.CODEV = 1.

An HDB3 code violation (CODEV) occurs when the device receives two consecutive bipolar violations of the same polarity (refer to ITU O.161). With CODEV detection enabled, LXT360/361 reports a violation on the BPV pin along with received BPVs and ZEROVs (if these options are enabled). LXT360/361 forces the BPV pin High for a full RCLK cycle to report a CODEV.

HDB3 Zero Substitution Violation Detection (*ZEROV*)

With encoders/decoders enabled, the LXT360/361 can detect HDB3 zero substitution violations (ZEROV) in Host Mode. This requires CR1.ENCENB = 1 and CR1.EC4-1 = 100x or 1010, which establish E1 operation, and CR4.ZEROV = 1.

LXT360/361 forces the BPV pin High for a full RCLK cycle to report a ZEROV. An HDB3 ZEROV is the receipt of four or more consecutive zeros. This does not occur with correctly encoded HDB3 data unless there are transmission errors. With ZEROV detection enabled, the device reports a violation on the BPV pin along with received BPVs and CODEVs (if these options are enabled).

ALARM CONDITION MONITORING

Loss of Signal (LOS)

The LXT360/361 Loss of Signal (LOS) monitor function is compatible with ITU G.775 and ETSI 300233. The receiver LOS monitor loads a digital counter at the RCLK frequency. The count increments with each received 0 and the counter resets to 0 on receipt of a 1. When the count reaches “n” 0s, the LOS flag goes High, and the MCLK replaces the recovered clock at the RCLK output in a smooth transition. For T1 operations, the number of 0s, $n = 175$, and for E1 operations, $n = 32$. In Host Mode, either number can be changed to 2048 by setting bit CR4.LOS2048 to 1.

For T1 operation, when the received signal has 12.5% 1s (16 marks in a sliding 128-bit period, with fewer than 100 consecutive 0s), the LOS flag returns Low and the recovered clock replaces MCLK at the RCLK output in another smooth transition.

For E1 operation, the LOS condition is cleared when the received signal has 12.5% 1s density (four 1s in a sliding 32-bit window with fewer than 16 consecutive 0s). In Host Mode E1 operation, the out-of-LOS criterion can be modified from 12.5% marks density to 32 consecutive marks by setting bit CR4.COL32CM = 1.

During LOS, the device sends received data to the RPOS/RNEG pins (or RDATA in Unipolar Mode). LXT360 reports an LOS condition on the LOS pin in Hardware Mode. In Host Mode, the LOS bit in the Performance Status Register goes High to indicate an LOS condition and will interrupt the host controller if so programmed.

Alarm Indication Signal Detection (AIS)

The Alarm Indication Signal (AIS) is available only in Host Mode. The receiver detects an AIS pattern when it receives fewer than three 0s in any string of 2048 bits. The device clears the AIS condition when it receives three or more 0s in a string of 2048 bits.

The AIS bit in the Performance Status Register indicates AIS detection. When the AIS status changes, the TAIS bit in the Transition Status Register goes High. The change of status interrupts the host controller by pulling INT Low, unless the interrupt is masked. Writing a 1 to the ICR.CAIS bit masks the interrupt until the bit returns to 0.

Driver Failure Open Mode (DFMO)

In Host Mode a DFM Open (DFMO) bit is available in the Performance Status Register to indicate an open condition

on the lines. DFMO can generate an INT to the host controller. The Transition Status Register bit DFMO indicates a transition in the status of the bit. Writing a 1 to ICR.CDFMO will clear or mask the interrupt.

Elastic Store Overflow/Underflow (ESOVR/ESUNF)

When the bit count in the Elastic Store (ES) is within two bits of overflowing or underflowing the ES adjusts the output clock by $\frac{1}{8}$ of a bit period. In Host Mode, the ES provides an indication of overflow and underflow in the TRS.ESOVR and TSR.ESUNF. These are sticky bits and will stay set to 1 until the host controller reads the register. These interrupts can be cleared or masked by writing a 1 to the bits ICR.CESO and ICR.CESU, respectively.

OTHER DIAGNOSTIC REPORTS

Receive Line Attenuation Indication (LATN)

The equalizer status register (ESR) provides an approximation of the line attenuation encountered by the device. The four most significant bits of the register (ESR.LATN7-4) indicate line attenuation in approximately 2.9 dB steps for both T1 and E1 operation of the receive equalizer. For instance, if ESR.LATN7-4 is 10 (decimal), then the receiver is seeing a signal attenuated by approximately 29 dB ($2.9 \text{ dB} * 10$) of cable loss.

Built-In Self Test (BIST)

LXT360/361 provides a Built-In Self Test (BIST) capability in Host Mode. The BIST exercises the internal circuits by providing an internal QRSS pattern, running it through the encoders and the transmit drivers then looping it back through the receive equalizer, Jitter Attenuator and decoders to the QRSS pattern detection circuitry. If all the blocks in this data path work correctly, the receive pattern detector locks onto the pattern. It then pulls INT Low and sets the following bits High:

- TSR.TQRSS
- PSR.QRSS
- PSR.BIST

The QPD pin (pin 12) also indicates completion status of the test. Starting the test forces this pin High. During the test, it remains High until the test finishes successfully at which time it goes Low.

The most reliable test will result with separate TCLK and MCLK and LBO = -22.5 dB (CR1.EC4-1 = 011x).

OPERATING MODES

The LXT360/361 share many features. However, their control modes are very different.

- The LXT360 operates in either Hardware or (Serial Port) Host Mode
- The LXT361 operates in (Parallel Port) Host Mode only.

In the Hardware Mode (LXT360 only) individual pins control the transceiver.

The logic level at the MODE pin sets the LXT360 mode of operation. In Host Mode (LXT360/361), a microprocessor controls the device through a data interface. The LXT360

has a serial interface and the LXT361 uses a parallel interface.

Hardware Mode Operation (LXT360 Only)

The LXT360 operates in Hardware Mode when MODE is set to Midrange or Low. In Hardware Mode individual pins access and control the transceiver. The outputs (RPOS/RNEG or RDATA) are valid on the rising edge of RCLK

There are some advanced functions provided only in Host Mode. Interrupt (INT), AIS detection indicator, DFM open indicator and CLKE functions are some of the features available in Host Mode.

Table 14: Control and Operational Mode Selection for LXT360 Transceiver

Input to Pin ¹		Mode of Operation						
Mode	TRSTE	Hardware	Software	Unipolar	Bipolar	AMI Enc/Dec	B8ZS/HDB3 Encoder/Decoder	All Outputs Tristated
Low	Low	On	Off	Off	On	Off ³	Off	No
Low	High	On	Off	Off	On	Off ³	Off	Yes
Low	Open	On	Off	On	Off	On	Off	No
High ²	Low	Off	On	x	x	x	x	No
High ²	High	Off	On	x	x	x	x	Yes
High ²	Open	Off	On	x	x	x	x	No
Open	Low	On	Off	On	Off	Off	On	No
Open	High	On	Off	On	Off	Off	On	Yes
Open	Open	On	Off	On	Off	Off	On	No

1. Open is either a midrange voltage or the pin is floating
 2. In Software Mode, the contents of register CR1 determine the operation mode.
 3. Encoding is done externally.

Host Mode Operation

The LXT360 operates in Host Mode when MODE is set High. In Host Mode a microprocessor accesses and controls the transceiver through a data port using the internal registers. The outputs (RPOS/RNEG or RDATA) are valid on the rising edge of RCLK

In Host Mode there are eight control and status registers—five read/write and three read-only registers. The LXT360 accesses them through its serial interface (SIO). The LXT361 provides this access using an 8-bit parallel interface (PIO).

The host processor/controller can completely configure the device as well as get a full diagnostic/status report through the SIO or PIO. Only the clocks and data for Bipolar Mode and BPV/Logic Error insertions for Unipolar or QRSS Mode need to be provided directly to the input pins. Similarly, the recovered clock, data, and BPV/Logic Error occurrences are available only at output pins. All other mode settings and diagnostic information are available through the data port.

LXT360/361 Integrated T1/E1 LH/SH Transceivers

Table 15 shows the address used by the SIO or PIO to access each register on the LXT360 or LXT361, respectively. Table 16 summarizes the control and status registers and labels each bit they contain. Tables 17 through 24 identify the bits in each register.

Table 15: Serial (LXT360) and Parallel (LXT361) Port Register Addresses

1. Bit CR3.PCLKE is available only in the LXT361; for the LXT360, set this bit to zero.

2. In write registers, bits labeled *reserved* should be set to 0 (except as in note 3 below) for normal operation and ignored in read only registers.

3. Write a 1 into this bit for normal operation.

Table 17: Control Register #1 Read/Write, Address (A7-A1) = x010000

Bit	Name	Function	Jitter Attenuation		
			JASEL0	JASEL1	Position
0	EC1	Set the Equalizer Control codes (see Table 12).	1	0	Transmit
1	EC2		1	1	Receive
2	EC3		0	X	disabled
3	EC4				
4	UNIENB	Enables Unipolar I/O Mode and insertion/detection of BPVs.			
5	ENCENB	Enables B8ZS/HDB3 encoders/decoders; device enters Unipolar Mode and pins 3, 4, 6 and 7 change to their unipolar functions.			
6	JASEL0	Jitter Attenuation Mode, selects jitter attenuation circuitry position in data path or disables it. See right hand section of table for values. ↗			
7	JASEL1				

Table 18: Control Register #2 Read/Write, Address (A7-A1) = x010001

Bit	Name	Function	Pattern		
			EPAT0	EPAT1	Selected
0	ERLOOP ¹	Enables Remote Loopback (RLOOP)	0	0	Transmit TPOS/TNEG
1	ELLOOP ¹	Enables Local Loopback (LLOOP)	0	1	Detect and transmit QRSS
2	EALOOP	Enables Analog Loopback (ALOOP)	1	0	In-band Loop Up Code 00001
3	ENLOOP	Enables Network Loopback Detection (NLOOP)	1	1	In-band Loop Down Code 001
4	ETAOS	Enables Transmit All Ones (TAOS)			
5	EPAT0	Enables internal data pattern transmission. See right hand section of table for values. ↗			
6	EPAT1				
7	RESET	RESET = 1 resets device state and all registers.			

1. To enable Dual Loopback (DLOOP), set both ERLOOP = 1, ELLOOP = 1.

Table 19: Control Register #3 Read/Write, Address (A7-A1) = x010010

Bit	Name	Description
0	ESJAM	Disables jamming of elastic store read out clock ($1/8$ bit-time adjustment for over/underflow).
1	ESCEN	Centers ES pointer for a difference of 16 or 32 (depending on depth-clears automatically).
2	ES64	Increases ES depth from 32 to 64 bits.
3	—	<i>reserved—set to 0 for normal operation.</i>
4	EQZMON	Configures receiver equalizer for monitor mode application .
5	SBIST	Starts built-in self test.
6	PLCKE	This bit is available only in the LXT361— <i>for LXT360, set this bit to 0.</i> PCLKE = 0 sets RPOS/RNEG valid on the rising edge of RCLK. PCLKE = 1 sets RPOS/RNEG valid on the falling edge of RCLK .
7	JA6HZ	When JA6HZ = 1, changes bandwidth of Jitter Attenuation Loop from 3 Hz (default) to 6 Hz.

Table 20: Interrupt Clear Register Read/Write, Address (A7-A1) = x010011

Bit	Name	Function ¹
0	CLOS	Clears/Masks LOS interrupt.
1	CNLOOP	Clears/Masks NLOOP interrupt.
2	CAIS	Clears/Masks AIS interrupt.
3	CQRSS	Clears/Masks QRSS Interrupt.
4	—	<i>reserved—set to 1 for normal operation.</i>
5	CDFMO	Clears/Masks DFMO.
6	CESO	Clears/Masks ES overflow interrupt.
7	CESU	Clears/Masks ES underflow interrupt.

1. Leaving a one of in any of these bits masks the associated interrupt.

Table 21: Transition Status Register Read Only, Address (A7-A1) = x010100

Bit	Name	Function
0	TLOS	Loss of Signal (LOS) has changed since last clear LOS interrupt occurred.
1	TNLOOP	NLOOP has changed since last clear NLOOP interrupt occurred.

1. A QRSS transition indicates receive QRSS pattern sync or loss. A simple error in QRSS pattern is not reported as a transition.
2. Tripping the overflow or underflow indicator in the ES sets the ESOVR/ESUNF status bit(s). Reading the Transition Status Register clears these bits. Setting CESO and CESU in the Interrupt Clear Register masks these interrupts.

Table 21: Transition Status Register *Read Only, Address (A7-A1) = x010100*

Bit	Name	Function
2	TAIS	AIS has changed since last clear AIS interrupt occurred.
3	TQRSS	QRSS has changed since last clear QRSS interrupt occurred ¹ .
4	—	<i>reserved-ignore.</i>
5	TDFMO	DFMO has changed since last clear DFMS interrupt occurred.
6	ESOVR	ES overflow status sticky bit ² .
7	ESUNF	ES underflow status sticky bit ² .

1. A QRSS transition indicates receive QRSS pattern sync or loss. A simple error in QRSS pattern is not reported as a transition.
 2. Tripping the overflow or underflow indicator in the ES sets the ESOVR/ESUNF status bit(s). Reading the Transition Status Register clears these bits. Setting CESO and CESU in the Interrupt Clear Register masks these interrupts.

Table 22: Performance Status Register *Read Only, Address (A7-A1) = x010101*

Bit	Name	Function
0	LOS	Loss of signal (LOS) status.
1	NLOOP	Network Loop (NLOOP) status.
2	AIS	Alarm Indicator (AIS) status.
3	QRSS	QRSS pattern detect status.
4	—	<i>reserved-ignore.</i>
5	DFMO	Driver open indication.
6	BIST	Built-in self test status.
7	—	<i>reserved-ignore</i>

Table 23: Equalizer Status Register *Read Only, Address (A7-A1) = x010110*

Bit	Name	Function
0	—	<i>reserved-ignore</i> (Least Significant Bit)
1	—	<i>reserved-ignore</i>
2	—	<i>reserved-ignore</i>
3	—	<i>reserved-ignore</i>
4	LATN4	Receive Line Attenuation Indicators. Convert this binary output to a decimal number and multiply by 2.9 dB to determine the approximate cable attenuation as seen by the receiver. For instance, if LATN7-4 = 1010 _{BIN} (= 10 _{DEC}), then the receiver is seeing a signal attenuated by approximately 29 dB (2.9 dB x 10) of cable.
5	LATN5	
6	LATN6	
7	LATN7	

Table 24: Control Register #4 Read/Write, Address (A7-A1) = x010111

Bit	Name	Function
0	CODEV	Enables detection of HDB3 code violation on the BPV pin along with bipolar violations and ZEROVs (as enabled).
1	ZEROV	Enables detection of four consecutive zeros (an HDB3 coding violation) on the BPV pin along with bipolar violation and ZEROVs (as enabled).
2	LOS2048	Changes LOS detection threshold from 32 consecutive zeros (for E1 operation) or 175 consecutive zeros (T1 operation) to 2048 consecutive zeros in either environment.
3	COL32CM	In E1 Mode, changes “clear LOS condition” criterion from 12.5% marks density (default) to receipt of 32 consecutive marks.
4	—	<i>reserved—set to 0 for normal operation; ignore when reading.</i>
5	—	<i>reserved—set to 0 for normal operation; ignore when reading.</i>
6	—	<i>reserved—set to 0 for normal operation; ignore when reading.</i>
7	—	<i>reserved—set to 0 for normal operation; ignore when reading.</i>

Serial Port Operation (LXT360 Only)

The LXT360 operates in Host Mode when the MODE pin is set High. Figure 12 shows the SIO data structure. The registers are accessible through a 16-bit word: an 8-bit Command/Address byte (bits R/W and A1-A7) and a subsequent 8-bit data byte (bits D0-7). Bit R/W determines whether a read or a write operation occurs. Bits A6-1 in the Command/Address byte address specific registers (the address decoder ignores bit A7). The data byte depends on both the value of bit R/W and the address of the register as set in the Command/Address byte.

Host Mode provides a latched interrupt output (INT). A change in the state of any of the following bits in the Performance Status Register will drive INT Low: LOS, NLOOP, AIS, QRSS, or DFMO. An interrupt will also occur when there is an elastic store overflow or underflow. When the interrupt has occurred, the INT output pin is pulled Low. The output stage of each INT pin consists only of a pull-down device, so each one requires an external pull-up resistor. The interrupt is cleared when the interrupt condition no longer exists, and the host processor writes a 1 to the respective interrupt causing bit(s) in the Interrupt Register. Leaving a 1 in any of these interrupt status bits masks that interrupt.

Table 25: CLKE Settings

CLKE	Output	Clock	Valid Edge
Low	RPOS	RCLK	Rising
	RNEG	RCLK	Rising
	SDO	SCLK	Falling
High	RPOS	RCLK	Falling
	RNEG	RCLK	Falling
	SDO	SCLK	Rising

Host Mode also allows control of the serial data and receive data output timing. The clock edge (CLKE) signal determines when the outputs are valid, relative to the Serial Clock (SCLK) or RCLK as shown in Table 25.

Parallel Port Operation (LXT361 Only)

The LXT361 address/control bus pins and control pins are compatible with both the Intel and Motorola address/data buses. See Figures 22 and 23 for the I/O timing diagram for each bus. The device automatically detects bus timing based on the Intel and Motorola microprocessor bus specifications. The maximum recommended processor speed for an Intel device is 20 MHz; for a Motorola device, 16.78 MHz. Table 17 summarizes the control and status registers for the LXT361. Tables 17 through 24 identify and explain the bits in the control registers.

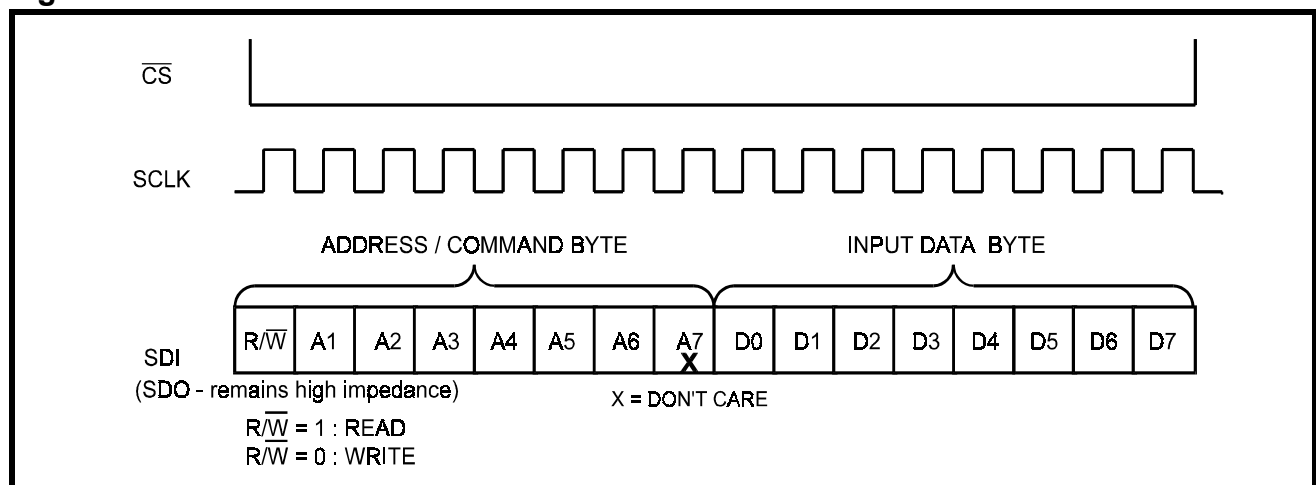

The LXT361 provides a latched interrupt output ($\overline{\text{INT}}$). A change in the state of any of the following bits in the Performance Status Register will drive $\overline{\text{INT}}$ Low: LOS, NLOOP, AIS, QRSS, DFMO. When the interrupt has occurred, the $\overline{\text{INT}}$ output pin is pulled Low. The output stage of $\overline{\text{INT}}$ pin consists only of a pull-down device, so

each pin requires an external pull-up resistor. The interrupt is cleared when the interrupt condition no longer exists, and the host processor writes a 1 to the respective interrupt causing bit(s) in the Interrupt Register. Leaving a 1 in any of these interrupt status bits masks that interrupt.

The received data output is valid on the rising edge of RCLK, when bit CR3.PCLKE = 0. The data output is valid on the falling edge of RCLK when CR3.PCLKE = 1.

There are five read/write and three read-only registers. Only bits A6-1 in the address byte are valid. (The address decoder ignores bits A7 and A0.) Tables 17 through 24 show the register address bits A7-1, without regard to bit A0.

Figure 12: LXT360 Serial Interface Data Structure

APPLICATION INFORMATION

NOTE

This application information is for design aid only.

Table 26 shows the specification for transmit return loss in E1 applications. (The G.703/CH PTT specification is a Swiss Telecommunications Ministry specification.)

Tables 27 through 30 show the transmit return loss values for E1 short- and long-haul and T1 applications. Table 37 shows the receive return loss values.

Table 26: E1 Transmit Return Loss Requirements

Frequency Band	Return Loss	
	ETS 300 166	G.703/CH PTT
51-102 kHz	6 dB	8 dB
102-2048 kHz	8 dB	14 dB
2048 - 3072 kHz	8 dB	10 dB

Table 27: Transmit Return Loss (2.048 Mbit/s–Short-Haul)

EC4-1	Xfrmr/Rt	Rload (Ω)	CI (pF)	Return Loss (dB)
1000	1:2/ 9.1 Ω	75	0	14
			470	16
		120	0	12

NOTE

Figure 13 shows a typical LXT360 application in either or T1 or E1 environment. See Tables 27 through 31 to select the transformers (T1 and T2), resistors (Rt and Rl) and capacitors (Cl) needed for this application.

NOTE

If the application includes surge protection, such as a varistor or sidactor on the TTIP/TRING lines, it may also require reducing the value of the capacitor CL or eliminating it completely. Excessive capacitance at CL will distort the transmitted signals.

Figure 13: Typical T1/E1 LXT360 Hardware Mode Application

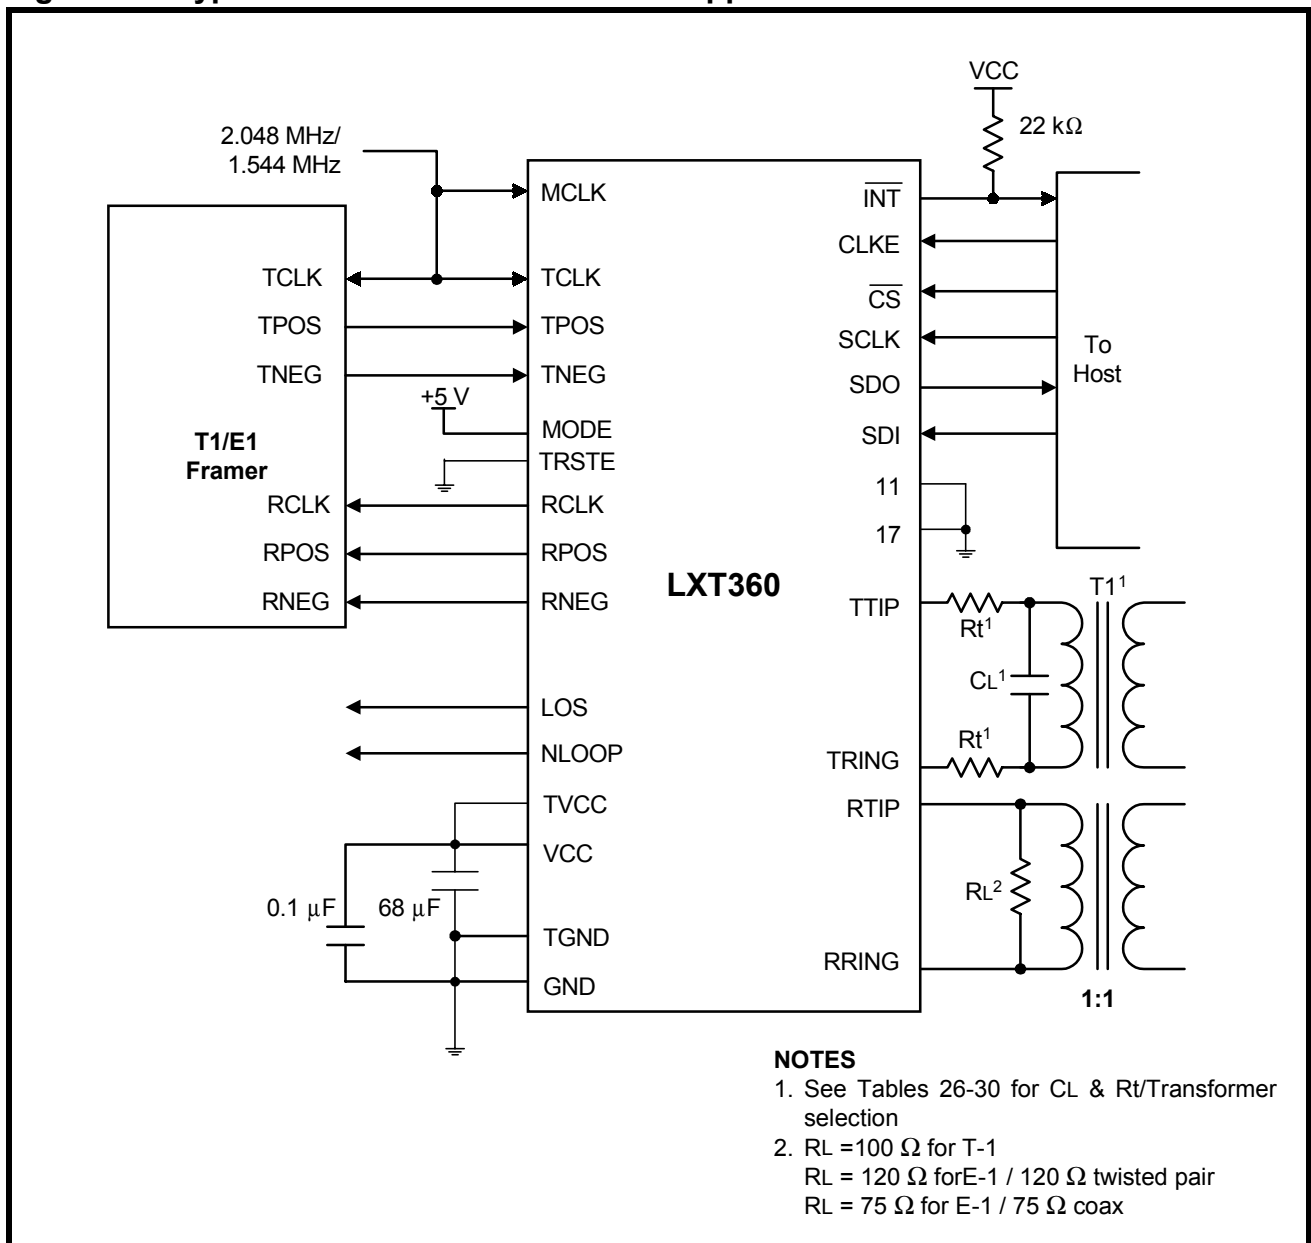

NOTE

Figure 14 shows an application using the LXT360 in its Host Controlled Mode. See Tables 27 through 31 to select the transformers (T1 and T2), resistors (Rt and Rl) and capacitors (Cl) needed for this application.

NOTE

If the application includes surge protection, such as a varistor or sidactor on the TTIP/TRING lines, it may also require reducing the value of the capacitor CL or eliminating it completely. Excessive capacitance at CL will distort the transmitted signals.

Figure 14: Typical T1/E1 LXT360 Host Mode Application

LXT360/361 Integrated T1/E1 LH/SH Transceivers

NOTE

Figure 15 shows an application using the LXT361. See Tables 27 through 31 to select the transformers (T1 and T2), resistors (Rt and Rl) and capacitors (Cl) needed for this application.

NOTE

If the application includes surge protection, such as a varistor or sidactor on the TTIP/TRING lines, it may also require reducing the value of the capacitor CL or eliminating it completely.

Figure 15: Typical T1/E1 LXT361 Application

TEST SPECIFICATIONS

NOTE

The minimum and maximum values in Tables 33 to 45 and Figures 16 through 26 represent the performance specifications of the LXT360 and LXT361 and are guaranteed by test, except where noted by design.

Table 33: Absolute Maximum Ratings

Parameter	Sym	Min	Max	Units
DC supply (reference to GND)	VCC, TVCC	–	6.0	V
Input voltage, any pin ¹	VIN	GND -0.3 V	VCC + 0.3 V	V
Input current, any pin ²	IIN	- 10	10	mA
Storage Temperature	TSTG	-65	150	° C
CAUTION Operation at these limits may permanently damage the device. Normal operation at these extremes not guaranteed.				
1. TVCC and VCC must not differ by more than 0.3 V during operation. TGND and GND must not differ by more than 0.3 V during operation. 2. Transient currents of up to 100 mA will not cause SCR latch-up. TTIP, TRING, TVCC, and TGND can withstand continuous currents of up to 100 mA.				

Table 34: Operating Conditions/Characteristics

Parameter			Sym	Min	Typ ¹	Max	Units	Test Conditions
DC Supply ²			VCC, TVCC	4.75	5.0	5.25	V	
Ambient operating temperature			TA	-40	–	85	° C	
Total Power Dissipation ³	T1	Short Haul	PD	–	310	380	mW	100% mark density
			PD	–	225	295	mW	50% mark density
		Long Haul	PD	–	245	325	mW	100% mark density
			PD	–	195	265	mW	50% mark density
	E1	Short Haul/ Long Haul	PD	–	275	330	mW	100% mark density
			PD	–	215	270	mW	50% mark density
1. Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing. 2. TVCC and VCC must not differ by more than 0.3 V. 3. Power dissipation while driving 75 Ω load over operating range for T1 operation or 60 Ω load for E1 operation. Includes power dissipation on device and load. Digital levels are within 10% of the supply rails and digital outputs driving a 50 pF capacitive load.								

LXT360/361 Integrated T1/E1 LH/SH Transceivers

Table 35: LXT360 Digital Characteristics ($T_a = -40$ to 85 °C, $V_+ = 5.0$ V \pm 5%, $GND = 0$ V)

Parameter	Sym	Min	Typ	Max	Units	Test Conditions
High level input voltage ^{1,2} (pins 1-4, 17, 23-25) ⁴	V _{IH}	2.0	–	–	V

High level input voltage ³ (pins 5, 9, 11, 26-28) ⁴	V _{IH}	3.5	–	–	V	
Midrange input voltage ³ (pins 5, 9, 11, 26-28) ⁴	V _{IM}	2.3	–	2.7	V	
Low level input voltage ³ (pins 5, 9, 11, 26-28) ⁴	Host Mode	V _{IL}	–	–	0.8	V
	H/W Mode	V _{IL}	–	–	1.5	V
Input leakage current	I _{LL}	0	–	\pm 50	μ A	
Three-state leakage current ¹ (all outputs)	I _{3L}	0	–	\pm 10	μ A	
TTIP/TRING leakage current (pins 13, 16) ⁴	I _{TR}	–	–	\pm 1.2	mA	in Idle and Power Down

1. Functionality of pin 23 and 25 depends on mode. See Host Mode and Hardware Mode description.
2. Output drivers will output CMOS logic levels into CMOS loads.
3. As an alternative to supplying 2.3 - 2.7 V to these pins, they may be left open.
4. Referenced pin numbers are for the NE and PE packages only. Refer to the diagram on page 2 for the appropriate LXT360QE pin assignments.

Table 36: LXT361 Digital Characteristics ($T_a = -40$ to 85 °C, $V_+ = 5.0$ V \pm 5%, $GND = 0$ V)

Parameter	Sym	Min	Typ	Max	Units	Test Conditions
High level input voltage ^{1,2} (pins 1-5, 9-12, 17, 23-28) ³	V _{IH}	2.0	–	–	V	
Low level input voltage ^{1,2} (pins 1-5, 9-12, 17, 23-28) ³	V _{IL}	–	–	0.8	V	
High level output voltage ^{1,2} (pins 6-8, 10, 11, 23, 28) ³	V _{OH}	2.4	–	–	V	I _{OUT} = 400 μ A
Low level output voltage ^{1,2} (pins 6-8, 10, 11, 23, 28) ³	V _{OL}	–	–	0.4	V	I _{OUT} = 1.6 mA
Input leakage current	I _{LL}	–	–	\pm 50	μ A	

1. Functionality of pins 23 and 25 depends on mode. See Host Mode description.
2. Output drivers will output CMOS logic levels into CMOS loads.
3. Referenced pin numbers are for the NE and PE packages only. Refer to the diagram on page 2 for the appropriate LXT360QE pin assignments.

Table 37: Analog Characteristics ($T_a = -40$ to 85 °C, $V_+ = 5.0$ V \pm 5%, $GND = 0$ V)

Parameter		Min	Typ ¹	Max	Units	Test Conditions
Recommended output load on TTIP/TRING		50	–	200	Ω	
AMI Output Pulse Amplitudes	DSX-1, DS1	2.4	3.0	3.6	V	$R_L = 100 \Omega$
	CEPT (ITU)	2.7	3.0	3.3	V	$R_L = 120 \Omega$
Jitter added by the transmitter ²	10 Hz - 8 kHz ³	–	–	0.02	UI	
	8 kHz - 40 kHz ³	–	–	0.025	UI	
	10 Hz - 40 kHz ³	–	–	0.025	UI	
	Broad Band	–	–	0.05	UI	
Receiver sensitivity @ 772 kHz (T1)	Mode 1 (EC1 = 1) (T1 Long-Haul)	0	–	26	dB	See Table 12 for Gain Setting
	Mode 2 (EC1 = 0) (T1 Long-Haul)	0	–	36	dB	
	Mode 3 (EC4 = 1) (T1 Short-Haul)	0	–	13.6	dB	
Receiver Sensitivity @ 1024 kHz (E1 line loss)	Mode 1 (EC4-1 = 1000) (E1 Short-Haul/12 dB)	0	–	13.6	dB	
	Mode 2 (EC4-1 = 1001 or EC4-1 = 1010) (E1 Long-Haul/43 dB)	0	–	43	dB	
Allowable consecutive zeros before LOS (T1)		160	175	190	–	
Allowable consecutive zeros before LOS (E1)		–	32	–	–	
Input jitter tolerance (T1)	10 kHz - 100 kHz	0.4	–	–	UI	0 dB line AT&T Pub 62411
	1 Hz ³	138	–	–	UI	
Input jitter tolerance (E1)	10 kHz - 100 kHz	0.2	–	–	UI	0 dB line ITU (G.823)
	1 Hz ³	37	–	–	UI	
Jitter attenuation curve corner frequency ⁴		–	3	–	Hz	selectable in data port
Receive Return Loss (E1)	51 kHz - 102 kHz	–	22	–	dB	
	102 kHz - 2.048 MHz	–	28	–	dB	
	2.048 MHz - 3.072 MHz	–	30	–	dB	

1. Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.
 2. Input signal to TCLK is jitter-free. The Jitter Attenuator is in the receive path or disabled.
 3. Guaranteed by characterization; not subject to production testing.
 4. Circuit attenuates jitter at 20 dB/decade above the corner frequency.

Figure 16: 2.048 MHz E1 Pulse (See Table 38)

Table 38: 2.048 MHz E1 Pulse Mask Specifications

Parameter	TWP	Coax	Unit
Test load impedance	120	75	Ω
Nominal peak mark voltage	3.0	2.37	V
Nominal peak space voltage	0 ±0.30	0 ±0.237	V
Nominal pulse width	244	244	ns
Ratio of positive and negative pulse amplitudes at center of pulse	95-105	95-105	%
Ratio of positive and negative pulse amplitudes at nominal half amplitude	95-105	95-105	%

Table 40: Master and Transmit Clock Timing Characteristics (T1 Operation) (Figure 18)

Parameter	Sym	Min	Typ ¹	Max	Units	Notes
Master clock frequency	MCLK	–	1.544	–	MHz	must be supplied
Master clock tolerance	MCLKt	–	±32	–	ppm	
Master clock duty cycle	MCLKd	40	–	60	%	
Transmit clock frequency	TCLK	–	1.544	–	MHz	
Transmit clock tolerance	TCLKt	–	–	±100	ppm	
Transmit clock duty cycle	TCLKd	10	–	90	%	
TPOS/TNEG to TCLK setup time	tsUT	50	–	–	ns	
TCLK to TPOS/TNEG hold time	tHT	50	–	–	ns	

1. Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.

Table 41: Master and Transmit Clock Timing Characteristics (E1 Operation) (Figure 18)

Parameter	Sym	Min	Typ ¹	Max	Units	Notes
Master clock frequency	MCLK	–	2.048	–	MHz	must be supplied
Master clock tolerance	MCLKt	–	±32	–	ppm	
Master clock duty cycle	MCLKd	40	–	60	%	
Transmit clock frequency	TCLK	–	2.048	–	MHz	
Transmit clock tolerance	TCLKt	–	–	±100	ppm	
Transmit clock duty cycle	TCLKd	10	–	90	%	
TPOS/TNEG to TCLK setup time	tsUT	50	–	–	ns	
TCLK to TPOS/TNEG hold time	tHT	50	–	–	ns	

1. Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.

Figure 18: Transmit Clock Timing

Table 42: Receive Timing Characteristics for T1 Operation (See Figure 19)

Parameter	Sym	Min	Typ ¹	Max	Units
Receive clock duty cycle ^{2, 3}	RLCKd	40	50	60	%
Receive clock pulse width ^{2, 3}	tpW	–	648	–	ns
Receive clock pulse width high	tpWH	–	324	–	ns
Receive clock pulse width low ^{1,3}	tpWL	260	324	388	ns
RPOS/RNEG to RCLK rising time	tSUR	–	274	–	ns
RCLK rising to RPOS/RNEG hold time	tHR	–	274	–	ns

1. Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.
 2. RCLK duty cycle widths will vary according to extent of received pulse jitter displacement. Max and Min RCLK duty cycles are for worst case jitter conditions.
 3. Worst case conditions guaranteed by design only.

Table 43: Receive Timing Characteristics for E1 Operation (See Figure 19)

Parameter	Sym	Min	Typ ¹	Max	Units
Receive clock duty cycle ^{2, 3}	RLCKd	40	50	60	%
Receive clock pulse width ^{2, 3}	tpW	–	488	–	ns
Receive clock pulse width high	tpWH	–	244	–	ns
Receive clock pulse width low ^{1,3}	tpWL	195	244	293	ns
RPOS/RNEG to RCLK rising time	tSUR	–	194	–	ns
RCLK rising to RPOS/RNEG hold time	tHR	–	194	–	ns

1. Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.
 2. RCLK duty cycle widths will vary according to extent of received pulse jitter displacement. Max and Min RCLK duty cycles are for worst case jitter conditions (0.4 UI clock displacement for 1.544 MHz.)
 3. Worst case conditions guaranteed by design only.

Figure 19: Receive Clock Timing

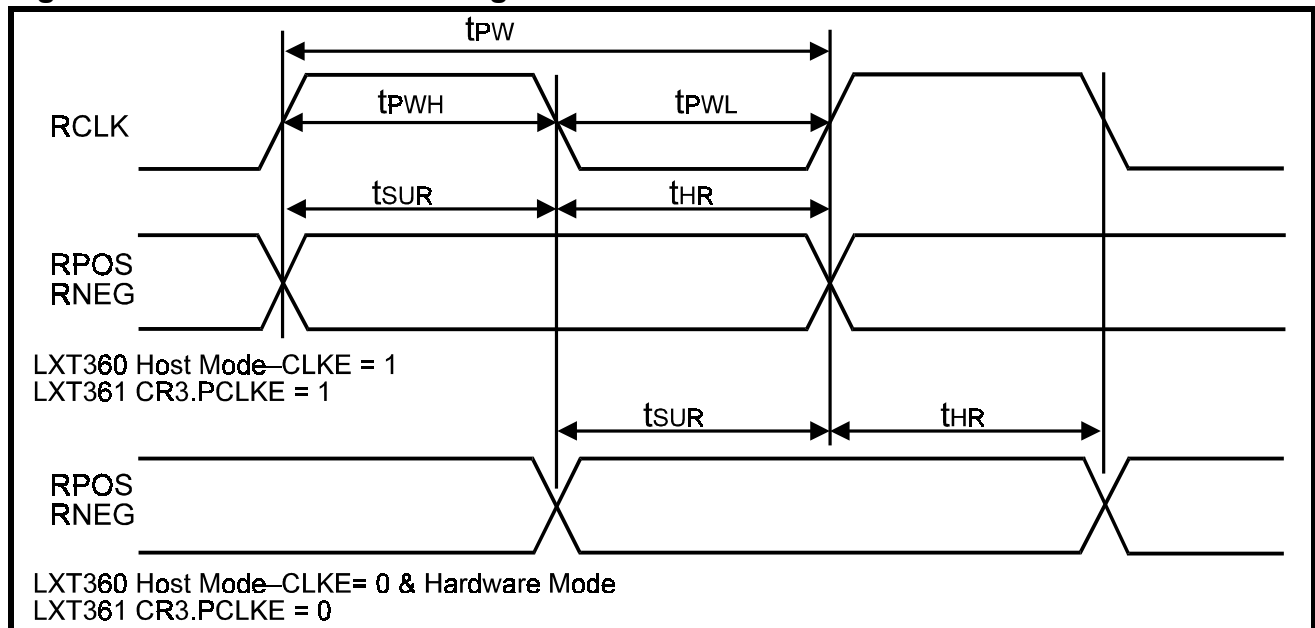

Table 44: LXT360 Serial I/O Timing Characteristics (See Figures 20 and 21)

Parameter	Sym	Min	Typ ¹	Max	Units	Parameter
Rise/fall time—any digital output	t_{RF}	–	–	100	ns	Load 1.6 mA, 50 pF
SDI to SCLK setup time	t_{DC}	50	–	–	ns	
SCLK to SDI hold time	t_{CDH}	50	–	–	ns	
SCLK low time	t_{CL}	240	–	–	ns	
SCLK high time	t_{CH}	240	–	–	ns	
SCLK rise and fall time	t_R, t_F	–	–	50	ns	
\overline{CS} falling edge to SCLK rising edge	t_{CC}	50	–	–	ns	
Last SCLK edge to \overline{CS} rising edge	t_{CCH}	50	–	–	ns	
\overline{CS} inactive time	t_{CWH}	250	–	–	ns	
SCLK to SDO valid time	t_{CDV}	–	–	200	ns	
SCLK falling edge or \overline{CS} rising edge to SDO high-Z	t_{CDZ}	–	100	–	ns	

1. Typical figures are at 25 °C and are for design aid only; not guaranteed and not subject to production testing.
