## DESCRIPTION

The 74LVC(H)162244A is a high-performance, low power, low voltage, Si-gate CMOS device, superior to most advanced CMOS compatible TTL families. Inputs can be driven from either 3.3 or 5 V devices. In 3-state operation, outputs can handle 5 V. These features allow the use of these devices as a mixed 3.3 and 5 V environment.

The 74LVC(H)162244A is a 16-bit non-inverting buffer/line driver with 3-state outputs. The device can be used as four 4-bit buffers, two 8-bit buffers or one 16-bit buffer. The 3-state outputs are controlled by the output enable inputs  $1\overline{OE}$ ,  $2\overline{OE}$ ,  $3\overline{OE}$  and  $4\overline{OE}$ . A HIGH on  $n\overline{OE}$  causes the outputs to assume a high-impedance OFF-state.

The 74LVCH162244A bushold data inputs eliminates the need for external termination resistors to hold unused inputs.

The 74LVC(H)162244A is designed with 30 Ω series termination resistors in both HIGH and LOW output stages to reduce line noise.

## Notes

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ ).

$$P_D = C_{PD} \times V_{CC}^2 \times f_i \times N + \Sigma(C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

$f_i$  = input frequency in MHz;

$f_o$  = output frequency in MHz;

$C_L$  = output load capacitance in pF;

$V_{CC}$  = supply voltage in Volts;

$N$  = total load switching outputs;

$\Sigma(C_L \times V_{CC}^2 \times f_o)$  = sum of the outputs.

2. The condition is  $V_i = \text{GND to } V_{CC}$ .

#### Notes

1. All typical values are measured T<sub>amb</sub> = 25 °C.
2. Value is measured at V<sub>CC</sub> = 3.3 V.
3. For bushold parts, the bushold circuit is switched off when V<sub>I</sub> > V<sub>CC</sub> allowing 5.5 V on the input terminal.
4. Valid for data inputs of bushold parts (LVCH162244A) only. For data inputs only, control inputs do not have a bushold circuit.
5. The specified sustaining current at the data input holds the input below the specified V<sub>I</sub> level.
6. The specified overdrive current at the data input forces the data input to the opposite logic input state.
