

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER**DESCRIPTION**

The M62475FP is an IC that contains preamplifier/servo amplifier necessary for optical pickup servo control for CD player.

This IC also supports automatic adjustment with microcomputer control.

FEATURES

- Pickup servo control can consist of the M62475FP only
- Supporting 3-beam system
- Built-in serial data command interface with MCU to reduce load on MCU
- Built-in circuit for automatically adjusting tracking balance, tracking/focus gain
- Built-in internal self reset circuit

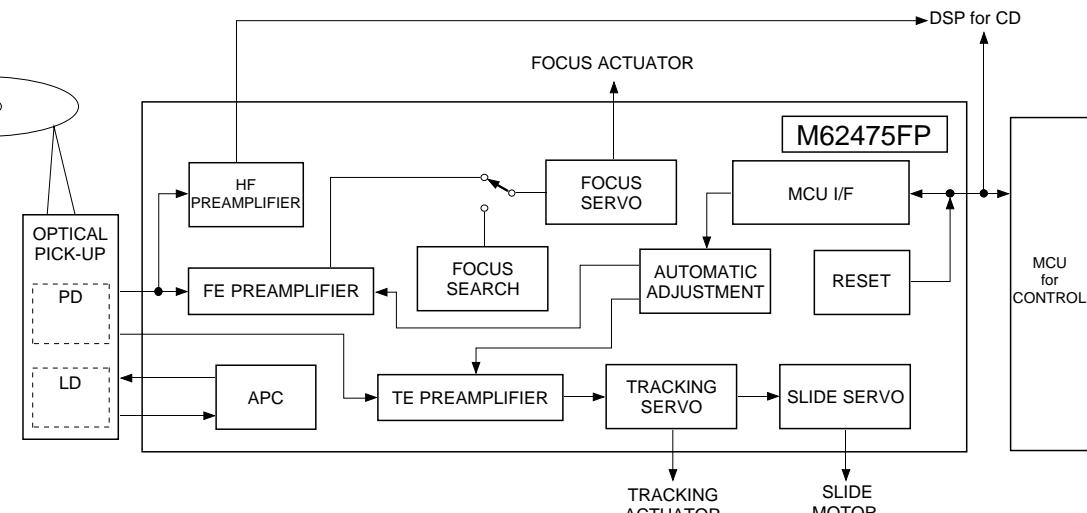

Outline 42P2R-A
0.8 mm pitch 450 mil SSOP
(8.4 mmX17.5 mmX2.0 mm)

RECOMMENDED OPERATING CONDITIONS

Supply voltage range.....Vcc=4.5 to 5.5V

Rated supply voltage.....Vcc=5V

BUILT-IN FUNCTION

- IV amplifier
- HF amplifier:HF (High Frequency Amp.)
- Focus Error Amplifier:FE (Focus Error Amp.)
- Focus Servo Amplifier:FS (Focus Servo Amp.)
- Tracking Error Amplifier:TE (Tracking Error Amp.)
- Tracking Servo Amplifier:TS (Tracking Servo Amp.)
- Sledge Motor Servo Amplifier:SS (Sledge Servo Amp.)
- Switching Circuit for Jump Brake:
TG1SW, TG2SW (Tracking Gain SW)
JF SW, JR SW (Jump Forward/Reverse SW)
SF SW, SR SW (Sledge Forward/Reverse SW)
- Focus Search Circuit
Search Signal Generator
FSOK Detector
- Track Cross Detector: TC Det (Track Cross Detector)
- Shock Detector: SC Det (Shock Detector)
- Logic Controller:
Serial Data Command Interface
Jump, Brake, Focus Search Control
Adjustment Control
- Vcc/2 generation circuit
- Auto Laser Power Control: APC (Automatic laser Power Control)
- HF Bottom Level Detector
- MR Detector
- Automatic Adjustment Circuit
Tracking balance adjustment circuit
Tracking gain adjustment circuit
Focus gain adjustment circuit
Gain adjustment signal generation and phase detection circuit

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER

FUNCTION DESCRIPTION

Setting Built-in Constant Current Source Current Value

The current value of Tracking Servo (TS) and Sledge Servo (SS) constant current can be set with resistance value Rx connected between pin (28) and Vcc.

If the absolute values for TS and SS constant source current values are assumed to be I (JF, JR) and I (SF, SR), respectively, they are set as follows.

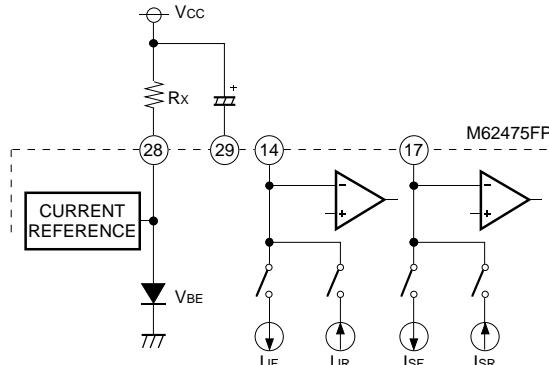

$$I_{(JF, JR)} = \frac{1}{8} \cdot \frac{V_{CC} - V_{(28)}}{R_X}$$

$$I_{(SF, SR)} = \frac{1}{4} \cdot \frac{V_{CC} - V_{(28)}}{R_X}$$

Where, $V_{(28)}$ is the voltage of pin (28). If the voltage of pin (21) (GND) is assumed to be $V_{(21)}$, $V_{(28)}$ can be found by the following formula.

$$V_{(28)} = V_{(21)} + V_{BE} \quad (V_{BE} \approx 0.7V \text{ standard})$$

CONSTANT CURRENT SOURCE BLOCK DIAGRAM

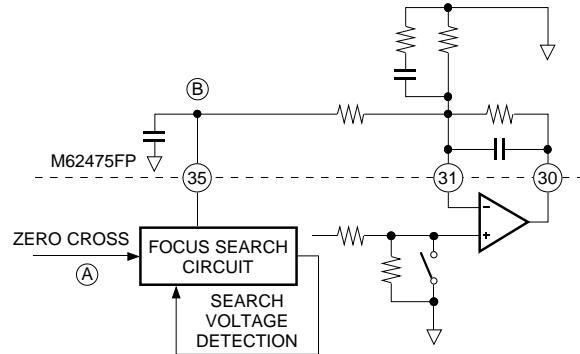

FSR Detector

When the focus search is performed, the focus search direction is automatically switched.

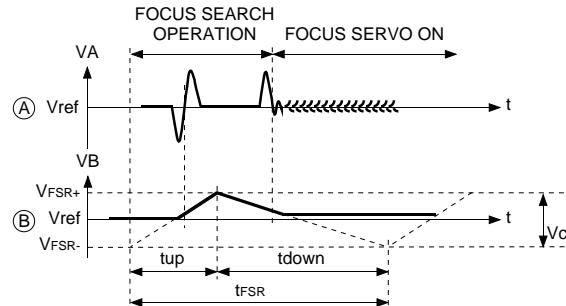

The focus search always starts from the (+) side. The polarity (+/-) direction) internal logic signal of the focus search voltage is used for control and switching.

FZC detection is effective only in a direction.

EQUIVALENT CIRCUIT

FZC OPERATION TIMING CHART

Setting FSR time t_{FSR} (C_{FSR} setting)

$$t_{FSR} = \frac{C_{FSR}}{I_{FSR}}$$

C_{FSR}:CFSR pin (35) external capacitor

At time of rising: 110µA

At time of falling: 60µA

FSR V_{th±} Voltage setting

V_{th+}: V_{ref}+0.7V

V_{th-}: V_{ref}-0.7V

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER**AUTOMATIC ADJUSTMENT FUNCTION**

The IC is capable of automatically adjusting the three places of tracking balance, tracking gain and focus gain.

TRACKING BALANCE ADJUSTMENT

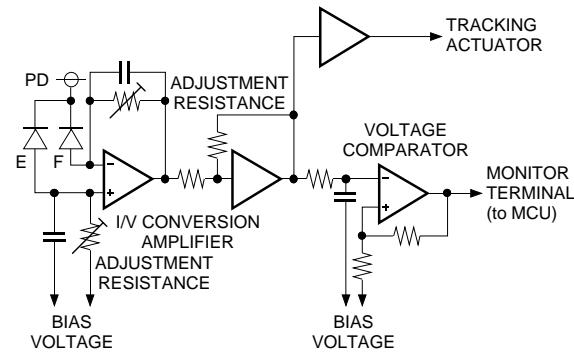

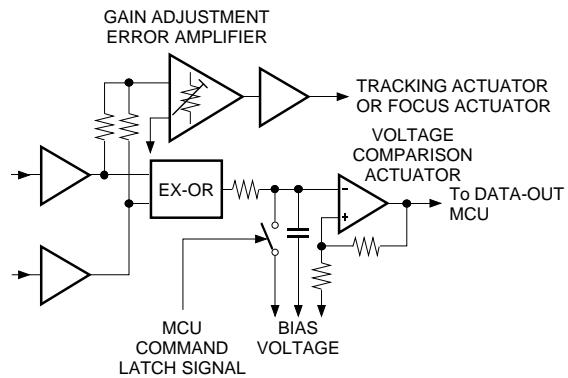

The input resistance of the I/V conversion amplifier connected to E and F pickups and the 8-step adjustment resistance built in a feedback resistance are switched for the adjustment. The adjustment precision is approximately 3% by the step.

The automatic adjustment operation enters an oscillation signal from the automatic adjustment signal generator of MCU into a servo loop to forcibly make the beam cross the track. When this is the case, the output voltage of I/V conversion amplifier is integrated. If the E and F output signals are well balanced and are the same, an error voltage is not generated in the output voltage after this integration and a reference voltage is obtained. If they are not balanced, a voltage of a DC component is generated. The result of having compared this output voltage and the reference voltage is converted into a logical level and is then output to the monitor terminal. The MCU is used for control and the result is judged. According to the result, the adjustment resistance of the I/V conversion amplifier is sequentially switched step by step for the adjustment in the direction of reversing the current logical result. At the time when the result has been reversed, the error is judged to be put within a one-step error and the adjustment is complete.

TRACKING FOCUS GAIN ADJUSTMENT

The input resistance of the tracking focus error amplifier and the 8-step adjustment resistance built in a feedback resistance are switched for the adjustment. The adjustment precision is approximately 1 dB by the step.

The adjustment operation enters an oscillation signal with the output gain of -3 dB in a servo loop from the automatic adjustment signal generator of MCU into a servo loop to forcibly generate a gap in the track and focus. A waveform adjusted signal of the generated tracking focus error signal and the MCU oscillation signal are collated with each other with respect to the phase and is then integrated to convert the phase difference into the voltage. The result of having compared this output voltage and the reference voltage is converted into a logical level and is then output to the monitor terminal. The MCU is used for control and the result is judged. According to the result, the input resistance of the amplifier is sequentially switched step by step in feedback resistance for the adjustment in the direction of reversing the current logical result. At the time when the result has been reversed, the error is judged to be put within a one-step error and the adjustment is complete.

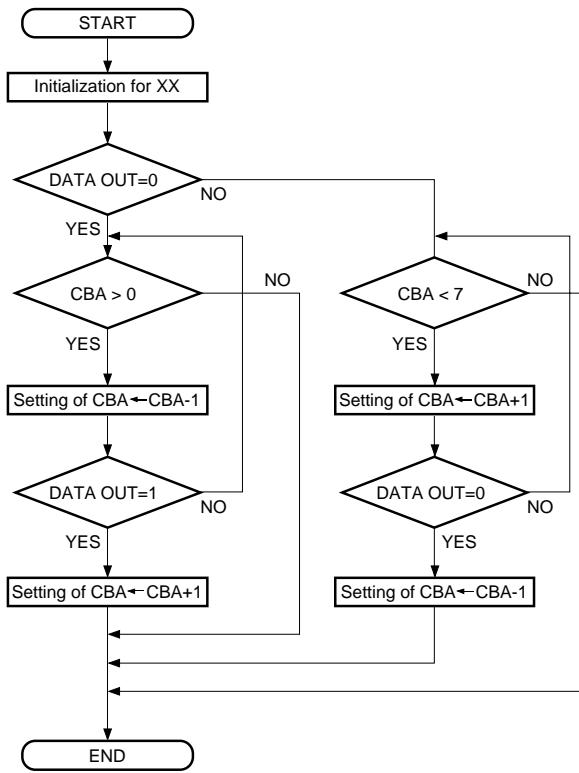

EQUIVALENT CIRCUIT (Tracking Balance)**EQUIVALENT CIRCUIT (Tracking Focus Gain)**

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER

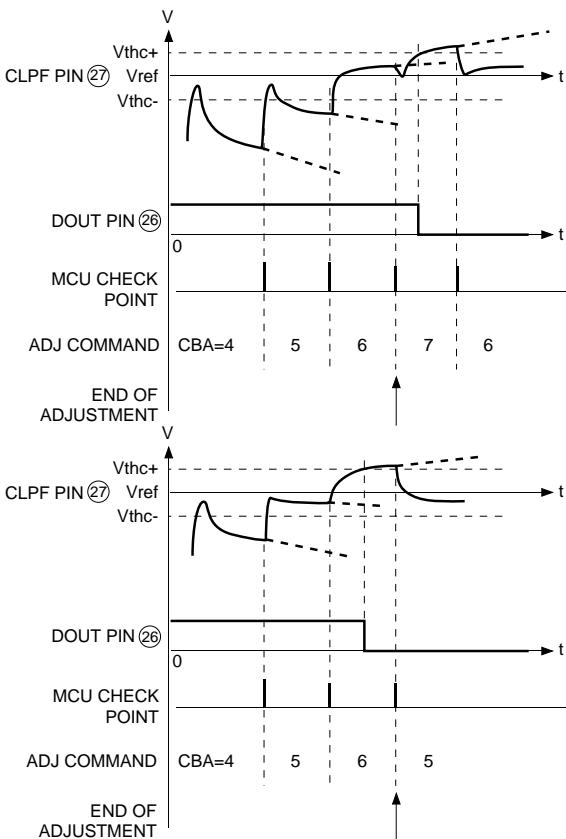

AUTOMATIC ADJUSTMENT FLOWCHART

BASIC ROUTINE

Serial data command: XXOOOCBA (XX is specified according to the adjustment command.)

AUTOMATIC ADJUSTMENT EXAMPLE

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER**SERIAL COMMAND FUNCTION**

An 8-bit shift register is installed in the logic controller to convert (decode) serial data (MSD pin 25) from the microcomputer into a command for the servo IC.

FUNCTION DESCRIPTION of Data-IN

Of the 8-bit data, high order 4 bits (D7 to D4) is used to select a command mode and low-order 4 bits (D3 to D0) are used to set (instruct) the command status.

Commands in the same mode can be given concurrently with data transferred once. They are held until new data is entered. Therefore, the command status is held if another mode is selected.

SERIAL COMMAND FUNCTION TABLE

Command Name	MSD pin 25 input								Data out pin output	
	Mode selection				Command status setting					
	D7	D6	D5	D4	D3	D2	D1	D0		
SERVO	0	0	Focus	Brake /Shock	Track		Sledge		FSOK/TC	
Track balance	0	1	—	—	—	C	B	A	ADJ	
Track Gain	1	0	—	—	—	C	B	A	ADJ	
Focus Gain	1	1	—	—	—	C	B	A	ADJ	

Note 1. Output from DOUT pins 25 is automatically switched by selecting each mode.

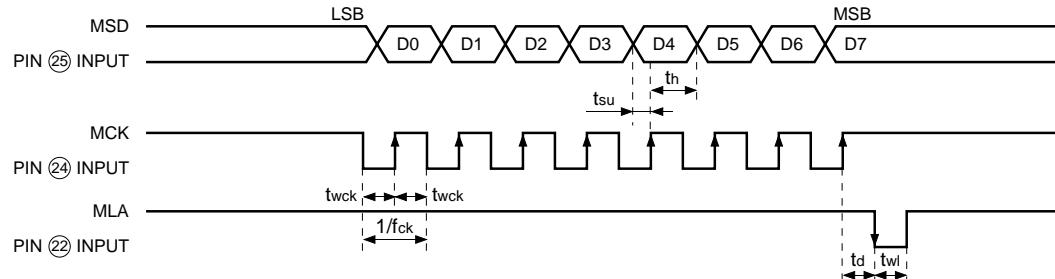

2. The status in the Servo Mode is set with two bits for each of command Track (D3,D2) and sledge(D1,D0).

COMMAND FUNCTION TABLE

Command	Mode	Data		Function				
FS ON	Focus	D5	1 ON	<ul style="list-style-type: none"> • APC amplifier ON • Focus search start to servo ON (PS SW="OPEN") 				
			0 OFF	<ul style="list-style-type: none"> • APC amplifier OFF • Focus servo OFF (FS SW = "CLOSE") 				
Brake	Track1	D4	1	Jump brake (jump setting) operation Opens/closes TSSW.				
			0	Controls SW 'TG SW' for track gain switching.				
Track	Track2	D3	D2					
		0	0	TS OFF	Track servo OFF		For TSSW, JF SW, and JR SW, refer to 'TRACK Function Table'.	
		0	1	JR	Reverse jump			
		1	0	JF	Forward jump			
Sledge	Track2	1	1	TS ON	Track servo ON		For SS SW, SF SW, and SR SW, refer to 'TRACK Function Table'.	
		D3	D2					
		0	0	SS OFF	Sledge servo OFF			
		0	1	SR	Reverse sledge			
		1	0	SF	Forward sledge			
		1	1	SS ON	Sledge servo ON			

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER**SERIAL DATA (MSD) TRANSFER METHOD**

Data is transferred with LSB first and the MLA signal is sent to execute the command.

SERIAL DATA INPUT TIMING CHART**LOGIC INPUT CONDITIONS**

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
fck	Clock frequency		—	100	200	kHz
twck	Clock pulse width		2.5	5	—	μs
tsu	Setup time		0.1	0.2	—	μs
th	Hold time		2.5	5	—	μs
td	Delay time		2.5	5	—	μs
twl	Latch pulse width		1	5	—	μs

BRAKE

Setting the break command to "1" performs the jump brake operation to improve the jump setting capability after the track jump.

Jump Brake Operation

- The track servo loop is set to OFF with TC="↓" (at the falling edge of TCDet output) when MR is 1.
- The track servo loop is set to ON with TC="↓" (at the falling edge of TCDet) when MR is 0.
- Jump Brake True Value List (Effective in the TS ON mode)

INPUT		OUTPUT
MIRROR	TC Det	TS SW status
1 ("Mirror")	↓	OPEN (track servo OFF)
0 ("Track")	↓	CLOSE (track servo ON)

Note 3. TC/SHSW "CLOSE", TG SW "OPEN"

SHOCK

With the SHOCK command set to "1", the shock operation is carried out to switch the track gain at time of shock.

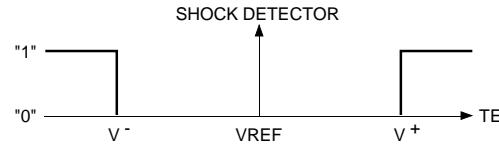

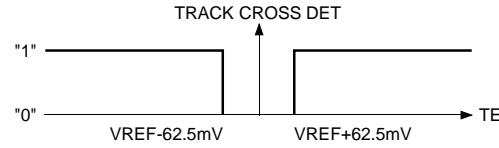

Jump Brake Operation

- With SHOCK detect=1, the track gain is placed in the shock mode.
- With SHOCK Det=0, the track gain is placed in the normal mode.
- Shock True Value List (Effective in the TS ON mode)

INPUT		OUTPUT
SHOCK Det		TG SW status
1 ("SHOCK")		OPEN (Shock mode)
0 ("NORMAL")		CLOSE (Normal mode)

Note 4. TC/SH SW "OPEN"

5. V⁺ and V⁻ are set with external constant.

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER**TRACK FUNCTION TABLE**

INPUT		OUTPUT (SW Status)			
COMMAND	DATA		TS SW	JF SW	JR SW
	D3	D2			
TS OFF	0	0	OPEN (Servo OFF)	OFF	OFF
JR	0	1	OPEN (Servo OFF)	OFF	ON
JF	1	0	OPEN (Servo OFF)	ON	OFF
TS ON	1	1	CLOSE (Servo ON)	OFF	OFF

SLEDGE FUNCTION LIST

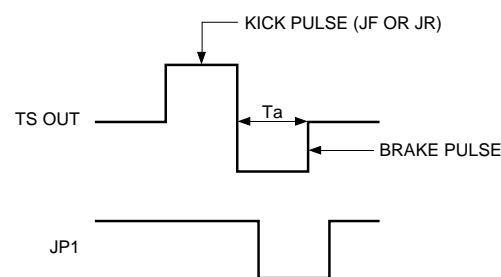

INPUT		OUTPUT (SW status)			
COMMAND	DATA		TS SW	SF SW	JR SW
	D1	D0			
SS OFF	0	0	CLOSE (Sledge OFF)	OFF	OFF
SR	0	1	CLOSE (Sledge OFF)	OFF	ON
SF	1	0	CLOSE (Sledge OFF)	ON	OFF
SS ON	1	1	OPEN (Sledge ON)	OFF	OFF

DIRECT COMMAND FUNCTIONJP1 signal

When a 1-track jump takes place, serial data to be transferred twice can be omitted to control the amount of delay in processing time.

JP1 is generally set to "1". When JP1 is set to "0" with TC (Data out) signal set to "1", the logic controller automatically reverses the jump polarity (JF to JR or JR to JF).

When a jump is complete (after fixed time Ta), switching JP1 from "0" to "1" can automatically terminate JF and JR to select the TR ON/SSON status.

Signal Waveform with a jump

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER**JP1 SIGNAL TRUE VALUE LIST**

JP1 (INPUT)	TRACK mode							
	TRACK (D3, D2)				SLEDGE (D3, D2)			
	00	11	10	01	00	11	10	01
1	TSOFF	TS ON	JF	JR	SS OFF	SS ON	SF	SR
1 → 0		TSOFF	TS ON	JR	JF	SS OFF	SS ON	SR
0 → 1		TSOFF	TS ON	JF	JR	SS OFF	SS ON	SF

LOGIC OUTPUT FUNCTIONData out

Data out output is switched according to the serial command (D6, D7="0", "0") mode (see the serial command function list).

The output corresponding to the serial command mode sent last is given.

Data Out Output Corresponding List

	Data out signal name	Serial command mode (input)
(1)	FSOK	FOCUS (0010XXXX)
(2)	TC	TRACK (0001XXXX)

(1) FS ON

With FS SW=OPEN (servo ON), FSOK "0" is output.

FSOK TRUE VALUE LIST

Input	Output
FF SW status	FSOK
CLOSE (Servo OFF)	1
CLOSE (Servo ON)	0

While FS OK is set to "1", TS SW is open (servo OFF) and SS SW is open regardless of the command status.

(2) TC

The TC signal that latches the MR signal at the edge (falling edge) of TCDet output is output.

TC TRUE VALUE LIST

Input	Output
MR	TC
"1"Mirror	
"0"Track	

MR signal detector

Detects an envelope of the HF signal and sends data to the internal logic controller.

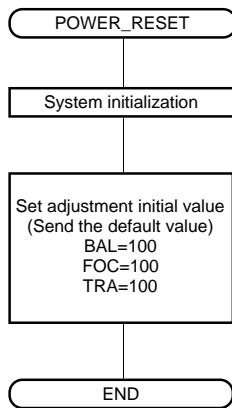

AUTOMATIC ADJUSTMENT CD PREAMPLIFIER SERVO CONTROLLER

CONTROL METHOD FLOWCHART EXAMPLE

Note: Since this description applies to an example on the item related to the servo, take into account the entire system when using this. In addition, pay attention to the simplification/reduction of actions in abnormal status.
