

128 Bit

X24C00

16 x 8 Bit

Serial E²PROM

FEATURES

- **2.7V to 5.5V Power Supply**
- **128 Bit Serial E²PROM**
- **Low Power CMOS**
 - Active Current Less Than 3mA
 - Standby Current Less Than 50µA
- **Internally Organized 16 x 8**
- **2 Wire Serial Interface**
 - Bidirectional Data Transfer Protocol
- **Byte Mode Write**
- **Self Timed Write Cycle**
 - Typical Write Cycle Time of 5ms
- **Push/Pull Output**
- **High Reliability**
 - Endurance: 100,000 Cycles
 - Data Retention: 100 Years
- **Available Packages**
 - 8-Lead MSOP
 - 8-Lead PDIP
 - 8-Lead SOIC

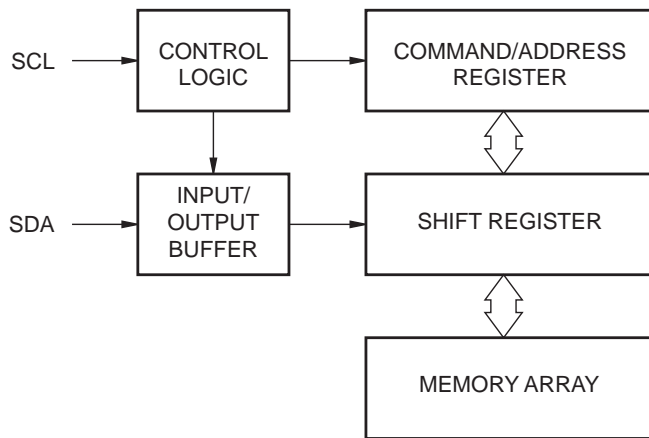

DESCRIPTION

The X24C00 is a CMOS 128 bit serial E²PROM, internally organized as 16 x 8. The X24C00 features a serial interface and software protocol allowing operation on a simple two wire bus.

Xicor E²PROMs are designed and tested for applications requiring extended endurance. Inherent data retention is greater than 100 years.

The X24C00 is fabricated with Xicor's Advanced CMOS Floating Gate technology.

PIN CONFIGURATION

3836 FHD F02.1

X24C00

PIN DESCRIPTIONS

Serial Clock (SCL)

The SCL input is used to clock all data into and out of the device.

Serial Data (SDA)

SDA is a bidirectional pin used to transfer data into and out of the device. It is a push/pull output and does not require the use of a pull-up resistor.

PIN NAMES

Symbol	Description
NC	No Connect
V _{SS}	Ground
V _{CC}	Supply Voltage
SDA	Serial Data
SCL	Serial Clock

3836 PGM T01

DEVICE OPERATION

The X24C00 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master will always initiate data transfers and provide the clock for both transmit and receive operations. Therefore, the X24C00 will be considered a slave in all applications.

Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions. Refer to Figures 1 and 2.

Start Condition

All commands are preceded by the start condition, which is a HIGH to LOW transition of SDA when SCL is HIGH. The X24C00 continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition has been met.

A start may be issued to terminate the input of a control word or the input of data to be written. This will reset the device and leave it ready to begin a new read or write command. Because of the push/pull output, a start cannot be generated while the part is outputting data. Starts are also inhibited while a write is in progress.

Stop Condition

The stop condition is a LOW to HIGH transition of SDA when SCL is HIGH. The stop condition is used to reset the device during a command or data input sequence and will leave the device in the standby mode. As with starts, stops are inhibited when outputting data and while a write is in progress.

Write Operation

The byte write operation is initiated with a start condition. The start condition is followed by an eight bit control byte which consists of a two bit write command (0,1), four address bits, and two "don't care" bits (Figure 3).

X24C00

Figure 1. Data Validity

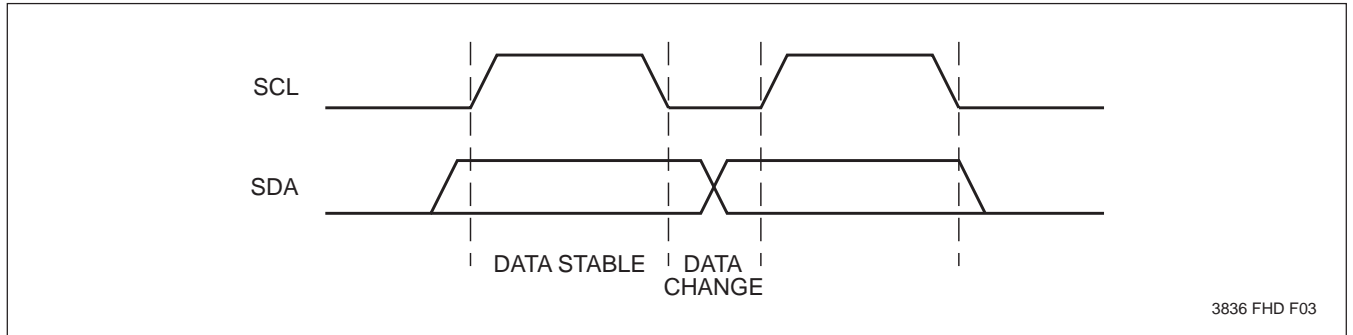

Figure 2. Definition of Start and Stop Conditions

Figure 3. Control Byte

X24C00

After receipt of the control byte, the X24C00 will enter the write mode and await the data to be written. This data is shifted into the device on the next eight SCL clocks. Once eight clocks have been received, the data in the shift register will be written into the memory array. While the write is in progress the X24C00 will not respond to any inputs. At any time prior to clocking in the last data bit, a stop command or a new start command will terminate the operation. If a start command is given, the X24C00 will reset all counters and will prepare to clock in the next control byte. If a stop command is given, the X24C00 will reset all counters and await the next start command.

At the end of the write the X24C00 will automatically reset all counters and enter the standby mode. (Figure 4).

Read Operation

The byte read operation is initiated with a start condition. The start condition is followed by an eight-bit control byte which consists of a two-bit read command (1,0), four address bits, and two “don’t care” bits. After receipt of the control byte the X24C00 will enter the read mode and transfer data into the shift register from the array. This data is shifted out of the device on the next eight SCL clocks. At the end of the read, all counters are reset and the X24C00 will enter the standby mode. As with a write, the read operation can be interrupted by a start or stop condition while the command or address is being clocked in. While clocking data out, starts or stops cannot be generated.

During the second don’t care clock cycle, starts and stops are ignored. The master must free the bus prior to the end of this clock cycle to allow the X24C00 to begin outputting data (Figures 5 and 6).

ABSOLUTE MAXIMUM RATINGS*

Temperature under Bias	
X24C00	-65°C to +135°C
Storage Temperature	-65°C to +150°C
Voltage on any Pin with	
Respect to V_{SS}	-1V to +7V
D.C. Output Current	5mA
Lead Temperature	
(Soldering, 10 seconds)	300°C

*COMMENT

Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and the functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Temperature	Min.	Max.
Commercial	0°C	+70°C
Industrial	-40°C	+85°C
Military	-55°C	+125°C

3836 PGM T02.1

Supply Voltage	Limits
X24C00	5V ±10%
X24C00-3	3V to 5.5V
X24C00-2.7	2.7V to 5.5V

A.C. CHARACTERISTICS (Over the recommended operating conditions unless otherwise specified.)

Read & Write Cycle Limits

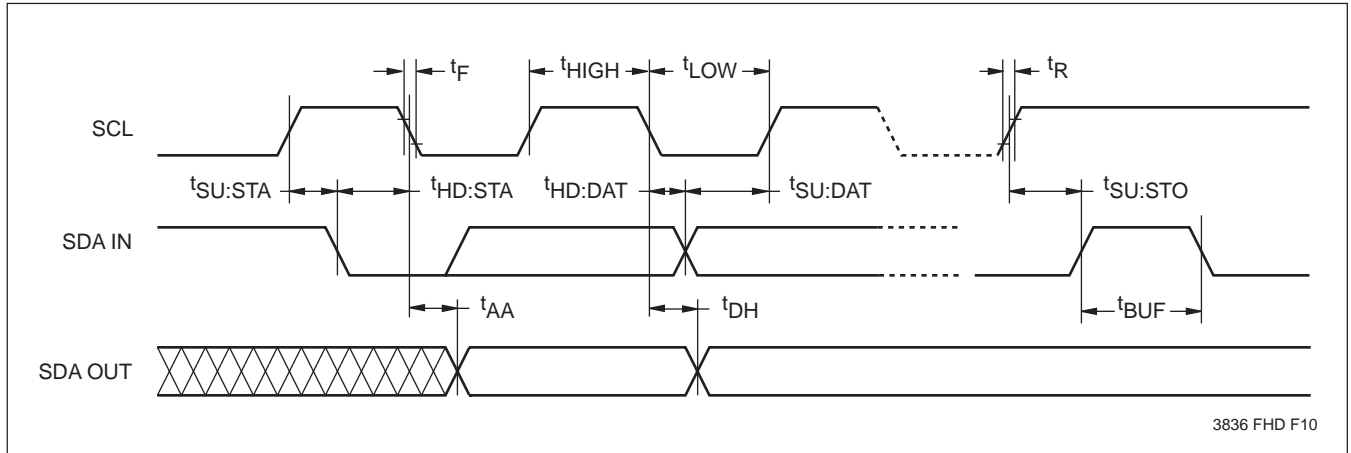

Symbol	Parameter	Min.	Max.	Units
f_{SCL}	SCL Clock Frequency	0	1	MHz
t_{AA}	SCL LOW to SDA Data Out Valid		350	ns
t_{BUF}	Time the Bus Must Be Free Before a New Transmission Can Start	500		ns
$t_{HD:STA}$	Start Condition Hold Time	250		ns
t_{LOW}	Clock LOW Period	500		ns
t_{HIGH}	Clock HIGH Period	500		ns
$t_{SU:STA}$	Start Condition Setup Time	250		ns
$t_{HD:DAT}$	Data In Hold Time	0		μ s
$t_{SU:DAT}$	Data in Setup Time	250		ns
t_R	SDA and SCL Rise Time		1	μ s
t_F	SDA and SCL Fall Time		300	ns
$t_{SU:STO}$	Stop Condition Setup Time	250		ns
t_{DH}	Data Out Hold Time	50		ns

3836 PGM T07.1

Note: (3) t_{PUR} and t_{PUW} are the delays required from the time V_{CC} is stable until the specified operation can be initiated. These parameters are periodically sampled and not 100% tested.

X24C00

Bus Timing

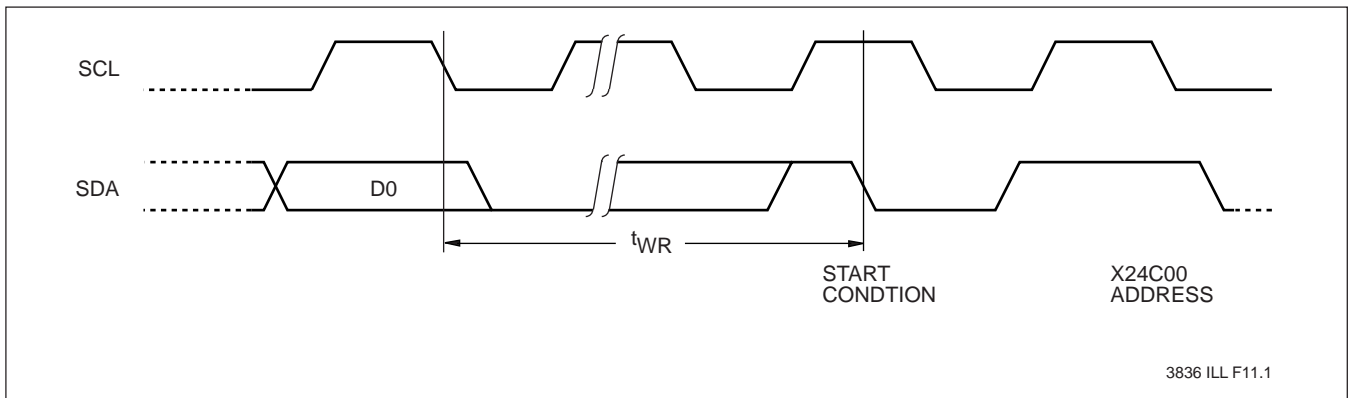

WRITE CYCLE LIMITS

Symbol	Parameter	Min.	Max.	Units
$t_{WR}^{(4)}$	Write Cycle Time		5	ms

3836 PGM T09

Write Cycle Timing

Note: (4) The write cycle time is the time from the initiation of a write sequence to the end of the internal erase/program cycle. During the write cycle, the X24C00 bus interface circuits are disabled, SDA is high impedance, and the device does not respond to start conditions.

LIMITED WARRANTY

Devices sold by Xicor, Inc. are covered by the warranty and patent indemnification provisions appearing in its Terms of Sale only. Xicor, Inc. makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. Xicor, Inc. makes no warranty of merchantability or fitness for any purpose. Xicor, Inc. reserves the right to discontinue production and change specifications and prices at any time and without notice.

Xicor, Inc. assumes no responsibility for the use of any circuitry other than circuitry embodied in a Xicor, Inc. product. No other circuits, patents, licenses are implied.

US. PATENTS

Xicor products are covered by one or more of the following U.S. Patents: 4,263,664; 4,274,012; 4,300,212; 4,314,265; 4,326,134; 4,393,481; 4,404,475; 4,450,402; 4,486,769; 4,488,060; 4,520,461; 4,533,846; 4,599,706; 4,617,652; 4,668,932; 4,752,912; 4,829,482; 4,874,967; 4,883,976; 4,980,859; 5,012,132; 5,003,197; 5,023,694. Foreign patents and additional patents pending.

LIFE RELATED POLICY

In situations where semiconductor component failure may endanger life, system designers using this product should design the system with appropriate error detection and correction, redundancy and back-up features to prevent such an occurrence.

Xicor's products are not authorized for use as critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
