

**Features**

- Operation to 1100MHz
- Very Low Power
- Single Supply Operation 2.7V to 5.25V
- Power Down Facility for Battery Economy
- Latched Modulus Control Input
- Push Pull Output Drive
- ESD Protection on All Pins†

**Description**

The SP8715 is a switchable divide by 64/65, 128/129 programmable divider which is guaranteed to operate up to 1100MHz. It will operate from a supply of 2.7V to 5.25V and requires typically 3.6mA (including the output current). It also features a power down facility for battery economy.

The RF inputs are internally biased and should be capacitively coupled to the signal source. The output is designed to interface with CMOS synthesisers.

Power down recovery time, $t_{pu}$ (notes 7,8)			6	$\mu s$	See Figure 9

**NOTES**

2. All electrical testing is performed at  $+85^{\circ}C$ .
3. Typical values are measured at  $+25^{\circ}C$  and  $V_{CC} = +5V$ .
4. Modulus Control and Ratio Select are high impedance inputs which can be driven directly by standard CMOS outputs.
5. Modulus control is latched at the end of the previous cycle.
6. See Figure 4.
7. See Figure 8.
8. These parameters are not tested but are guaranteed by design.
9. The ratio select pin is not intended to be switched dynamically.

**OPERATING NOTES**

The RF inputs are biased internally and are normally coupled to the signal source with suitable capacitors.

The output stage has a novel design and is intended to drive a CMOS synthesiser input. External pull-down resistors or circuits are not required. The SP8715 is not suitable for driving TTL or similar devices.

The device will operate down to DC frequencies for non-sinusoidal signals provided that the input slew rate is better than  $100V/\mu s$ .

POWER DOWN (pin 7) is connected internally to a pull-down resistor. If the battery economy facility is not used, pin 7 should be either left unconnected or connected to  $V_{EE}$ .
