## +5V High-Speed RS-232 Transceivers with 0.1µF Capacitors

### FEATURES

- 0.1µF External Charge Pump Capacitors
- 120kbps Data Rate
- Standard SOIC and SSOP Packages
- Multiple Drivers and Receivers
- Single 5V Supply Operation
- 1µA Shutdown Mode
- WakeUp Feature in Shutdown Mode
- Tri-State Receiver Outputs
- Meets All RS-232 and V.28 Specifications
- Improved Driver Output Capacity for Mouse Applications
- ±10kV ESD Protection\*

*Now Available in Lead Free Packaging*

Note: See page 4 & 5 for other pinouts.

### DESCRIPTION

The **SP200 Series** are multi-channel RS-232 line transceivers in a variety of configurations to fit most communication needs. All models in this Series feature low-power CMOS construction and **Sipex** patented (5,306,954) on-board charge pump circuitry to generate the ±10V RS-232 voltage levels, using 0.1µF charge pump capacitors to save board space and reduce circuit cost. The **SP200**, **SP206**, **SP207B**, **SP211** and **SP213** models feature a low-power shutdown mode, which reduces power supply drain to 1µA. A WakeUp function keeps the receivers active in the shutdown mode.

**FEATURES...**

The **SP200 Series** multi-channel RS-232 line transceivers provide a variety of configurations to fit most communication needs, especially those applications where ±12V is not available. All models in this Series feature low-power CMOS construction and **Sipex** proprietary on-board charge pump circuitry to generate the ±10V RS-232 voltage levels. The ability to use 0.1µF charge pump capacitors saves board space and reduces circuit cost. Different models within the Series provide different driver/receiver combinations to match any application requirement.

The **SP200, SP206, SP207B, SP211** and **SP213** models feature a low-power shutdown mode, which reduces power supply drain to 1µA. The WakeUp function keeps the receivers active in

the shutdown mode, unless disabled by the EN pin. Models with a “B” suffix are equipped with the WakeUp function.

Models in the Series are available in 28-pin SO (wide) and SSOP (shrink) small outline packages. Devices can be specified for commercial (0°C to +70°C) and industrial/extended (-40°C to +85°C) operating temperatures.

**THEORY OF OPERATION**  
**Charge-Pump**

The charge pump is a **Sipex** patented design (5,306,954) and uses a unique approach compared to older less-efficient designs. The charge pump still requires four external capacitors, but uses a four-phase voltage shifting technique to

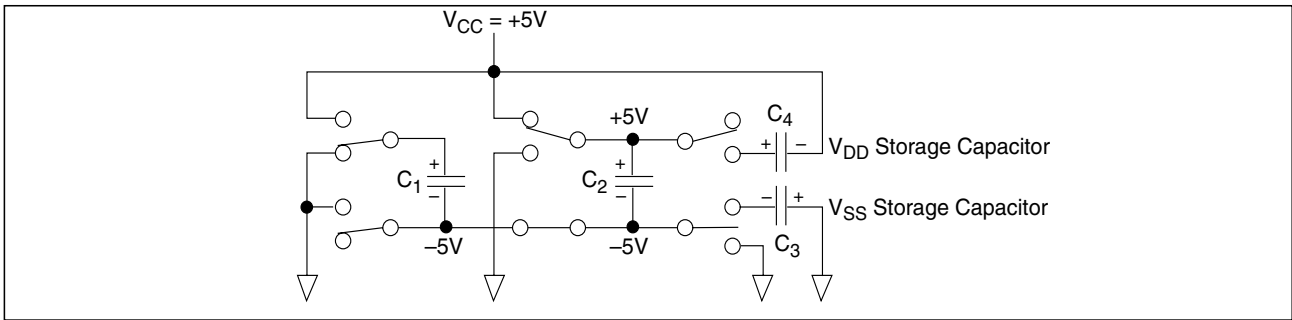

Figure 1. Charge Pump — Phase 1

attain symmetrical  $\pm 10\text{V}$  power supplies. Figure 3a shows the waveform found on the positive side of capacitor  $C_2$ , and Figure 3b shows the negative side of capacitor  $C_2$ . There is a free-running oscillator that controls the four phases of the voltage shifting. A description of each phase follows.

### Phase 1

—  $V_{SS}$  charge storage — During this phase of the clock cycle, the positive side of capacitors  $C_1$  and  $C_2$  are initially charged to  $+5\text{V}$ .  $C_1^+$  is then switched to ground and the charge in  $C_1^-$  is transferred to  $C_2^-$ . Since  $C_2^+$  is connected to  $+5\text{V}$ , the voltage potential across capacitor  $C_2$  is now  $10\text{V}$ .

### Phase 2

—  $V_{SS}$  transfer — Phase two of the clock connects the negative terminal of  $C_2$  to the  $V_{SS}$  storage capacitor and the positive terminal of  $C_2$  to ground, and transfers the generated  $-10\text{V}$  to  $C_3$ . Simultaneously, the positive side of capacitor  $C_1$  is switched to  $+5\text{V}$  and the negative side is connected to ground.

### Phase 3

—  $V_{DD}$  charge storage — The third phase of the clock is identical to the first phase — the charge

transferred in  $C_1$  produces  $-5\text{V}$  in the negative terminal of  $C_1$ , which is applied to the negative side of capacitor  $C_2$ . Since  $C_2^+$  is at  $+5\text{V}$ , the voltage potential across  $C_2$  is  $10\text{V}$ .

### Phase 4

—  $V_{DD}$  transfer — The fourth phase of the clock connects the negative terminal of  $C_2$  to ground, and transfers the generated  $10\text{V}$  across  $C_2$  to  $C_4$ , the  $V_{DD}$  storage capacitor. Again, simultaneously with this, the positive side of capacitor  $C_1$  is switched to  $+5\text{V}$  and the negative side is connected to ground, and the cycle begins again.

Since both  $V^+$  and  $V^-$  are separately generated from  $V_{CC}$ ; in a no-load condition  $V^+$  and  $V^-$  will be symmetrical. Older charge pump approaches that generate  $V^-$  from  $V^+$  will show a decrease in the magnitude of  $V^-$  compared to  $V^+$  due to the inherent inefficiencies in the design.

The clock rate for the charge pump typically operates at  $15\text{kHz}$ . The external capacitors can be as low as  $0.1\mu\text{F}$  with a  $16\text{V}$  breakdown voltage rating.

The **SP200 Series** devices are made up of three basic circuit blocks — 1) transmitter/driver, 2) receiver and 3) the **Sipex** proprietary charge

Figure 2. Charge Pump — Phase 2

Figure 3. Charge Pump Waveforms

pump. Each model within the Series incorporates variations of these circuits to achieve the desired configuration and performance.

### Transmitter/Driver

The drivers are inverting transmitters, which accept either TTL or CMOS inputs and output the RS-232 signals with an inverted sense relative to the input logic levels. Typically, the RS-232 output voltage swing is  $\pm 9V$  with no load, and  $\pm 5V$  minimum with full load. The transmitter outputs are protected against infinite short-circuits to ground without degradation in reliability. The drivers of the **SP200**, **SP206**, **SP206B**, **SP207B**, **SP211**, **SP211B** and **SP213** can be tri-stated by using the SHUTDOWN function.

In the “power off” state, the output impedance will remain greater than 300 Ohms, again satisfying the RS-232 specifications. Should the input of the

driver be left open, an internal 400kOhm pullup resistor to  $V_{CC}$  forces the input high, thus committing the output to a low state. The slew rate of the transmitter output is internally limited to a maximum of  $30V/\mu s$  in order to meet the EIA standards (EIA RS-232D 2.1.7, Paragraph 5). The transition of the loaded output from high to low also meets the monotonicity requirements of the standard.

### Receivers

The receivers convert RS-232 input signals to inverted TTL signals. Since the input is usually from a transmission line where long cable lengths and system interference can degrade the signal, the inputs have a typical hysteresis margin of 500mV. This ensures that the receiver is virtually immune to noisy transmission lines. Should an input be left unconnected, a 5kOhm pulldown resistor to ground will commit the output of the receiver to a high state.

Figure 4. Charge Pump — Phase 3

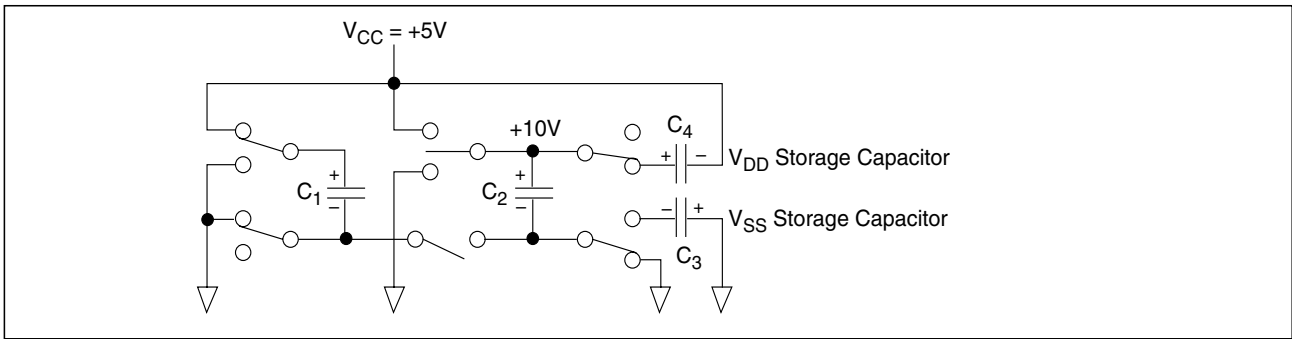

Figure 5. Charge Pump — Phase 4

**SHUTDOWN MODE**

The **SP200**, **SP206**, **SP206B**, **SP207B**, **SP211**, **SP211B** and **SP213** all feature a control input which will disable the device and reduce the power supply current to less than 10µA, making the parts ideal for battery-powered systems. In the “shutdown” mode the receivers and transmitters will both be tri-stated. The V<sup>+</sup> output of the charge pump will discharge to V<sub>CC</sub>, and the V<sup>-</sup> output will discharge to ground. Products with the WakeUp function can enable or disable the receivers during shutdown.

For complete shutdown to occur and the 10µA power drain to be realized, the following conditions must be met:

**SP200, SP206/B, SP207B and SP211/B:**

- +5V must be applied to the SD pin
- $\overline{\text{ENABLE}}$  must be either 0V, +5.0V or not connected
- the transmitter inputs must be either +5.0V or not connected
- V<sub>CC</sub> must be +5V
- Receiver inputs must be >0V and <+5V

**SP213:**

- 0V must be applied to the  $\overline{\text{SD}}$  pin
- ENABLE must be either 0V, +5.0V or not connected
- the transmitter inputs must be either +5.0V or not connected
- V<sub>CC</sub> must be +5V
- Receiver inputs must be >0V and <+5V

**ENABLE**

The **SP206/B**, **SP207/B**, **SP211** and **SP213** all feature an enable input, which allows the receiver outputs to be either tri-stated or enabled. This can be especially useful when the receiver is tied directly to a microprocessor data bus. For the **SP206/B**, **SP207/B** and **SP211**, enable is active low; that is, 0V applied to the ENABLE pin will enable the receiver outputs. For the **SP213**, enable is active high; that is, +5V applied to the ENABLE pin will enable the receiver outputs.

**WAKEUP FUNCTION**

The **SP206B**, **SP207B**, **SP211B** and **SP213** have a wake-up feature that keeps two or more receivers in an enabled state when the device is in the shutdown mode. The **SP213** has two receivers active (R<sub>4</sub> and R<sub>5</sub>), while the **SP207B** and **SP211B** have all receivers active during shutdown. With only the receivers active during shutdown, the devices draw 5–10µA of supply current.

SD	$\overline{\text{EN}}$	SP213 Only		Power Up/Down	Receiver Outputs
		$\overline{\text{SD}}$	EN		
0	0	1	1	Up	Enable
0	1	1	0	Up	Tri-state
1	0	0	1	Down	Enable
1	1	0	0	Down	Tri-state

Table 2. Wake-Up Truth Table

A typical application of this function would be where a modem is interfaced to a computer in a power-down mode. The ring indicator signal from the modem could be passed through an active receiver in the **SP2XXB/SP213** that is itself in the shutdown mode. The ring indicator signal would propagate through the **SP2XXB/SP213** to the power management circuitry of the

computer to power up the microprocessor and the **SP2XXB/SP213** drivers. After the supply voltage to the **SP2XXB/SP213** reaches +5.0V, the SHUTDOWN pin can be disabled, taking the **SP2XXB/SP213** out of the shutdown mode.

All receivers that are active during shutdown maintain 500mV (typ.) of hysteresis.

Table 3. EIA Standard Definitions

## EIA STANDARDS

The Electronic Industry Association (EIA) developed several standards of data transmission which are revised and updated in order to meet the requirements of the industry. In data processing, there are two basic means of communicating between systems and components. The RS-232 standard was first introduced in 1962 and, since that time, has become an industry standard.

The RS-232 is a relatively slow data exchange protocol, with a maximum baud rate of only 20kbaud, which can be transmitted over a maximum copper wire cable length of 50 feet. The **SP200** through **SP213** Series of data communications interface products have been designed

to meet both the EIA protocol standards, and the needs of the industry.

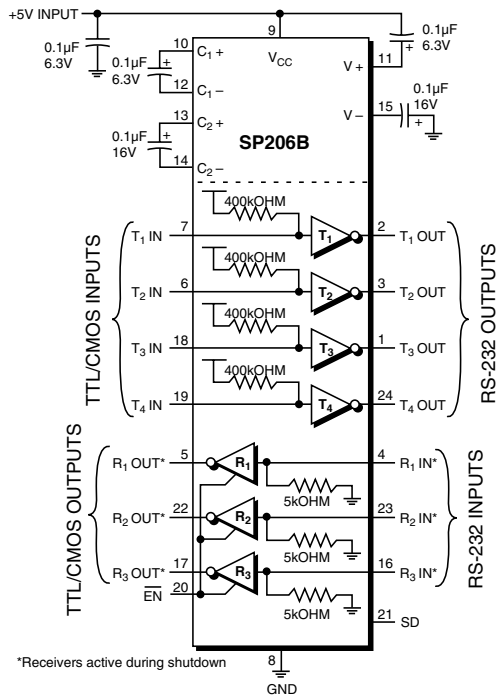

### $\pm 10\text{kV}$ ESD PROTECTION

The **SP200** Series is equipped with **Sipex**-proprietary ESD protection circuitry on all RS-232 inputs and outputs. The **SP200** Series has been characterized using MIL-STD-883C Method 3015.7 Human Body Model. Each device in the family can withstand up to  $\pm 10\text{kV}$  of static discharge on all RS-232 inputs and outputs. All other pins of each device will maintain  $\geq \pm 2\text{kV}$  of ESD protection.
