## 5-bit DAC, Synchronous PWM Power Regulator

### ■ FEATURES

- Compatible with HIP6004.
- Simple Voltage-Mode PWM Control.
- Dual N-Channel MOSFET Synchronous Drive.
- Fast Transient Response.
- $\pm 1\%$  5-Bit Digital-to-Analog Output Voltage.
- Adjustable Current Limit Without External Sense Resistor.
- Full 0% to 100% Duty Ratio.
- 200KHz Free-Running Oscillator, Programmable up to 350KHz.
- Power-Good Output Voltage Monitor.

### ■ APPLICATIONS

- Power Supply for Pentium® II, Power® and Alpha® Microprocessors.
- High-Power 5V to 3.xV DC/DC Regulators.
- Low-Voltage Distributed Power Supplies.

### ■ DESCRIPTION

The AIC1569A is a high power, high efficiency switching regulator controller optimized for high performance microprocessor applications. It is designed to drive dual N-channel MOSFETs in a standard synchronous buck topology. Featuring a digitally programmable switching regulator, the AIC1569A includes monitoring and protection capabilities in addition to all the essential synchronous PWM control functions.

The internal 5-bit Digital-to-Analog Converter (DAC) adjusts the output voltage from 2.0V to 3.5V in 0.1V increments and 1.3V to 2.0V in 0.05V increments. The precision reference and voltage-mode control can provide output regulation within  $\pm 1\%$  over temperature and line voltage shifts.

The internal oscillator of the AIC1569A free-runs at 200KHz and can be adjusted up to 350KHz. The resulting PWM duty ratio ranges from 0% to 100%. The error amplifier features an 11MHz bandwidth and 6V/ $\mu$ S slew rate, which enables high converter bandwidth for fast transient response.

The AIC1569A provides adjustable over current and short circuit protections. It senses the output current across the on resistance of the upper N-channel MOSFET without an external low value sense resistor. It also monitors the output voltage with a window comparator and issues a power good signal when the output is within 10% of the rated output voltage.

## ■ PIN DESCRIPTIONS

**PIN 1: VSEN** - Converter output voltage sense pin. Connect this pin to the converter output. The PGOOD and OVP comparator circuits use this signal to report output voltage status and perform overvoltage protection function.

**PIN 2: OCSET** - Current limit sense pin. Connect a resistor  $R_{OCSET}$  from this pin to the drain of the external MOSFET.  $R_{OCSET}$ , an internal  $200\mu A$  current source ( $I_{OCS}$ ), and the external MOSFET on-resistance ( $R_{DS(ON)}$ ) jointly set the over current trip point according to the following

equation:

$$I_{PEAK} = \frac{I_{OCS} \times R_{OCSET}}{R_{DS(ON)}}$$

If FB pin voltage is sensed to be below 50% of the internal voltage reference VDAC, the over current comparator cycles the soft-start function.

**PIN 3: SS**

- Soft start pin. Connect a capacitor from this pin to ground. An internal  $10\mu A$  current source provides soft start function for the converter.

PIN 4: VID0  
 PIN 5: VID1  
 PIN 6: VID2  
 PIN 7: VID3  
 PIN 8: VID4

- 5-bit DAC voltage select pin. TTL inputs used to set the internal voltage reference VDAC. When left open, these pins are internally pulled up to 5V and provide logic ones. The level of VDAC sets the converter output voltage as well as the PGOOD and OVP thresholds.

Table 1 specifies the VDAC voltage for the 32 combinations of DAC inputs.

PIN 9:COMP - External compensation pin. This pin is connected to error amplifier output and PWM comparator. An RC network is connected to FB pin to compensate the voltage-control feedback loop of the converter.

PIN 10:FB - The error amplifier inverting input pin. The FB pin and COMP pin are used to compensate the voltage-control feedback loop.

PIN 11:GND - Signal GND. It also serves as the power GND for the upper gate driver.

PIN 12:PGOOD- Power good indicator pin. PGOOD is an open drain output. This pin is pulled low when the converter output is  $\pm 10\%$  out of the VDAC reference voltage.

PIN 13:PHASE - Over current detection pin. Connect the PHASE pin to source of the external MOSFET. This pin detects the voltage drop across the MOSFET  $R_{DS(ON)}$  for over-current protection.

PIN 14:UGATE- External MOSFET gate drive pin. Connect UGATE to gate of the external MOSFET.

PIN 15:BOOT - External MOSFET driver power supply pin. To convert 5V main power to  $V_{CORE}$  power by driving N-channel MOSFET, supply voltage of no higher than 12V is recommended since the negative power terminal of the internal driver is internally tied to GND.

PIN 16:PGND - Driver power GND pin. PGND should be connected to a low impedance ground plane close to lower N-MOSFET source.

PIN 17:LGATE - Lower N-MOSFET gate driver pin.

PIN 18: VCC - The chip power supply pin. It also serves as power supply for LGATE driver. Recommended supply voltage is 12V.

PIN 19:OVP -Over voltage indicator pin. This pin also provides a driver source current to turn on an external SCR in the event of an over voltage condition.

PIN 20: RT - Frequency adjustment pin.  
 Connecting a resistor (RT) from this pin to GND, increase the frequency by the following equation.

$$F_s \cong 200\text{KHz} + \frac{5 \times 10^5}{\log R_T}$$
