

3V TYPE 8-BIT 8CH D-A CONVERTER WITH BUFFER AMPLIFIERS**DESCRIPTION**

The M62367GP is a CMOS semiconductor IC has 8 channels of 8-bit D-A converter. It is operable with a low supply voltage between 2.7~3.6V, and is easy to use due to serial data input, and 3-pin(DI,CLK,LD)connection with microcomputer.

The IC also contains Do pin terminal, enabling cascade connection, and therefore is suitable for automatic control in combination with a microcomputer.

FEATURES

- Operable with a low voltage between 2.7~3.6V
- 12-bit serial data input(connected via 3 pins:DI,CLK,LD)
- 8 channels of R-2R and segment type high-performance 8-bit D-A converters
- 8 buffer operational amplifiers with full swing of output voltage between Vcc and GND.
- High oscillation stability against the capacitive load of buffer operational amplifiers.

APPLICATION

Digital-analog conversion in industrial or home-use electronic equipment.

Automatic control in combination with EEPROM and microcomputer(Substitute for conventional semi-fixed resistor)
