

# Open-Drain SOT $\mu$ P Reset Circuit

## General Description

The MAX6315 low-power CMOS microprocessor ( $\mu$ P) supervisory circuit is designed to monitor power supplies in  $\mu$ P and digital systems. It provides excellent circuit reliability and low cost by eliminating external components and adjustments. The MAX6315 also provides a debounced manual reset input.

This device performs a single function: it asserts a reset signal whenever the  $V_{CC}$  supply voltage falls below a preset threshold or whenever manual reset is asserted. Reset remains asserted for an internally programmed interval (reset timeout period) after  $V_{CC}$  has risen above the reset threshold or manual reset is deasserted. The MAX6315's open-drain  $\overline{\text{RESET}}$  output can be pulled up to a voltage higher than  $V_{CC}$ .

The MAX6315 comes with factory-trimmed reset threshold voltages in 100mV increments from 2.5V to 5V. Preset timeout periods of 1ms, 20ms, 140ms, and 1120ms (min) are also available. The device comes in a SOT143 package.

For microcontrollers ( $\mu$ Cs) and  $\mu$ Ps with bidirectional reset pins, see the MAX6314 data sheet.

## Applications

Computers  
 Controllers  
 Intelligent Instruments  
 Critical  $\mu$ P and  $\mu$ C Power Monitoring  
 Portable/Battery-Powered Equipment

## Pin Configuration

## Features

- ◆ Small SOT143 Package
- ◆ Open-Drain  $\overline{\text{RESET}}$  Output Can Exceed  $V_{CC}$
- ◆ Precision, Factory-Set  $V_{CC}$  Reset Thresholds: 100mV Increments from 2.5V to 5V
- ◆ Four Reset Timeout Periods Available: 1ms, 20ms, 140ms, or 1120ms (minimum)
- ◆ Immune to Short  $V_{CC}$  Transients
- ◆ 5 $\mu$ A Supply Current
- ◆ Pin-Compatible with MAX811
- ◆ Guaranteed Over Temperature

## Ordering Information

PART <sup>†</sup>	NOMINAL $V_{TH}$ (V)	MIN $t_{RP}$ (ms)	TOP MARK <sup>††</sup>
MAX6315US50D1-T	5.00	1	FX_ _

<sup>†</sup>The MAX6315 is available in a SOT143 package, -40°C to +125°C temperature range.

<sup>††</sup>The first two letters in the package top mark identify the part, while the remaining two letters are the lot tracking code. Devices are available in both leaded and lead-free packaging. Specify lead-free by replacing "-T" with "+T" when ordering.

**Note:** All devices available in tape-and-reel only. Contact factory for availability.

Ordering Information continued at end of data sheet.

## Typical Operating Circuit

# Open-Drain SOT $\mu$ P Reset Circuit

## ABSOLUTE MAXIMUM RATINGS

$V_{CC}$ .....	-0.3V to +6.0V
RESET.....	-0.3V to +6.0V
All Other Pins.....	-0.3V to ( $V_{CC} + 0.3V$ )
Input Current ( $V_{CC}$ ).....	20mA
Output Current (RESET).....	20mA
Rate of Rise ( $V_{CC}$ ).....	100V/ $\mu$ s

Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ )	
SOT143 (derate 4mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$ ).....	320mW
Operating Temperature Range .....	$-40^\circ\text{C}$ to $+125^\circ\text{C}$
Storage Temperature Range .....	$-65^\circ\text{C}$ to $+160^\circ\text{C}$
Lead Temperature (soldering, 10s).....	$+300^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

( $V_{CC} = +2.5V$  to  $+5.5V$ ,  $T_A = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ , unless otherwise noted. Typical values are at  $T_A = +25^\circ\text{C}$ .)

	$V_{IH}$					
$\overline{\text{MR}}$ Minimum Input Pulse			1			$\mu\text{s}$
$\overline{\text{MR}}$ Glitch Rejection				100		ns
$\overline{\text{MR}}$ to Reset Delay				500		ns
$\overline{\text{MR}}$ Pull-Up Resistance			32	63	100	k $\Omega$
$\overline{\text{RESET}}$ Output Voltage	$V_{OL}$	$V_{CC} > 4.25V$ , $I_{SINK} = 3.2mA$			0.4	V
		$V_{CC} > 2.5V$ , $I_{SINK} = 1.2mA$			0.3	
		$V_{CC} > 1.2V$ , $I_{SINK} = 0.5mA$			0.3	
		$V_{CC} > 1.0V$ , $I_{SINK} = 80\mu\text{A}$			0.3	
$\overline{\text{RESET}}$ Output Leakage Current		$V_{CC} > V_{TH}$ , $\overline{\text{RESET}}$ deasserted			1	$\mu\text{A}$

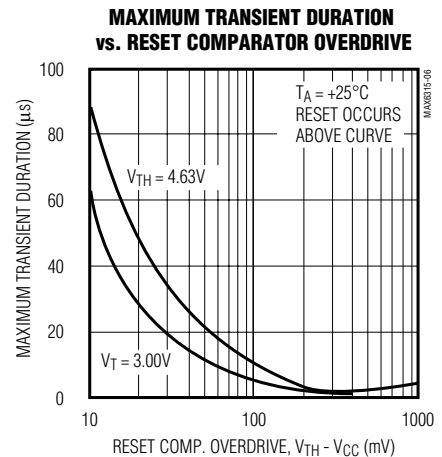

**Note 1:** The MAX6315 monitors  $V_{CC}$  through an internal factory-trimmed voltage-divider that programs the nominal reset threshold. Factory-trimmed reset thresholds are available in 100mV increments from 2.5V to 5V (see the *Ordering Information*).

# Open-Drain SOT $\mu$ P Reset Circuit

## Typical Operating Characteristics

( $T_A = +25^\circ\text{C}$ , unless otherwise noted.)

MAX6315

## Pin Description

PIN	NAME	FUNCTION
1	GND	Ground
2	$\overline{\text{RESET}}$	Active-Low Open-Drain Output. Connect to an external pullup resistor. Can be pulled up to a voltage higher than $V_{CC}$ , but less than 6V.
3	$\overline{\text{MR}}$	Manual Reset Input. A logic-low on $\overline{\text{MR}}$ asserts reset. Reset remains asserted as long as $\overline{\text{MR}}$ is low, and for the reset timeout period ( $t_{RP}$ ) after the reset conditions are terminated. Connect to $V_{CC}$ if not used.
4	$V_{CC}$	Supply Voltage and Reset Threshold Monitor Input

# Open-Drain SOT $\mu$ P Reset Circuit

## Detailed Description

### Reset Output

A microprocessor's ( $\mu$ P's) reset input starts the  $\mu$ P in a known state. The MAX6315 asserts reset to prevent code-execution errors during power-up, power-down, or brownout conditions.  $\overline{\text{RESET}}$  is guaranteed to be a logic-low for  $V_{CC} > 1\text{V}$  (see the *Electrical Characteristics* table). Once  $V_{CC}$  exceeds the reset threshold, the internal timer keeps reset asserted for the reset timeout period ( $t_{RP}$ ); after this interval  $\overline{\text{RESET}}$  goes high. If a brownout condition occurs (monitored voltage dips below its programmed reset threshold),  $\overline{\text{RESET}}$  goes low. Any time  $V_{CC}$  dips below the reset threshold, the internal timer resets to zero and  $\overline{\text{RESET}}$  goes low. The internal timer starts when  $V_{CC}$  returns above the reset threshold, and  $\overline{\text{RESET}}$  remains low for the reset timeout period.

The MAX6315's  $\overline{\text{RESET}}$  output structure is a simple open-drain n-channel MOSFET switch. Connect a pull-up resistor to any supply in the 0V to +6V range. Select a resistor value large enough to register a logic low when  $\overline{\text{RESET}}$  is asserted (see the *Electrical Characteristics* table), and small enough to register a logic high while supplying all input current and leakage paths connected to the  $\overline{\text{RESET}}$  line. A 10k $\Omega$  pullup is sufficient in most applications.

Often, the pull-up connected to the MAX6315's  $\overline{\text{RESET}}$  output will connect to the supply voltage monitored at the IC's  $V_{CC}$  pin. However, some systems may use the open-drain output to level-shift from the monitored supply to reset circuitry powered by some other supply (Figure 1). This is one useful feature of an open-drain output. Keep in mind that as the MAX6315's  $V_{CC}$  decreases below 1V, so does the IC's ability to sink current at  $\overline{\text{RESET}}$ . Finally, with any pullup,  $\overline{\text{RESET}}$  will be pulled high as  $V_{CC}$  decays toward 0V. The voltage where this occurs depends on the pull-up resistor value and the voltage to which it connects (see the *Electrical Characteristics* table).

### Manual-Reset Input

Many  $\mu$ P-based products require manual-reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. A logic low on  $\overline{\text{MR}}$  asserts reset. Reset remains asserted while  $\overline{\text{MR}}$  is low, and for the reset active timeout period after  $\overline{\text{MR}}$  returns high.

Figure 1. MAX6315 Open-Drain  $\overline{\text{RESET}}$  Output Allows Use with Multiple Supplies

$\overline{\text{MR}}$  has an internal 63k $\Omega$  pullup resistor, so it can be left open if not used. Connect a normally open momentary switch from  $\overline{\text{MR}}$  to GND to create a manual reset function; external debounce circuitry is not required. If  $\overline{\text{MR}}$  is driven from long cables or if the device is used in a noisy environment, connecting a 0.1 $\mu$ F capacitor from  $\overline{\text{MR}}$  to ground provides additional noise immunity.

## Applications Information

### Negative-Going $V_{CC}$ Transients

In addition to issuing a reset to the  $\mu$ P during power-up, power-down, and brownout conditions, these devices are relatively immune to short-duration negative-going transients (glitches). The *Typical Operating Characteristics* show the Maximum Transient Duration vs. Reset Threshold Overdrive, for which reset pulses are not generated. The graph was produced using negative-going pulses, starting at  $V_{RST\ max}$  and ending below the programmed reset threshold by the magnitude indicated (reset threshold overdrive). The graph shows the maximum pulse width that a negative-going  $V_{CC}$  transient may typically have without causing a reset pulse to be issued. As the transient amplitude increases (i.e., goes farther below the reset threshold), the maximum allowable pulse width decreases. A 0.1 $\mu$ F bypass capacitor mounted close to  $V_{CC}$  provides additional transient immunity.
