16-bit Proprietary Microcontroller

CMOS

F²MC-16LX MB90330 Series

MB90333A/F334A/V330A

■ DESCRIPTION

The MB90330 series are 16-bit microcontrollers designed for applications, such as personal computer peripheral devices, that require USB communications. The USB feature supports not only 12-Mbps Function operation but also Mini-HOST operation. It is equipped with functions that are suitable for personal computer peripheral devices such as displays and audio devices, and control of mobile devices that support USB communications. While inheriting the AT architecture of the F²MC* family, the instruction set supports the C language and extended addressing modes and contains enhanced signed multiplication and division instructions as well as a substantial collection of improved bit manipulation instructions. In addition, long word processing is now available by introducing a 32-bit accumulator.

* : F²MC stands for FUJITSU Flexible Microcontroller, a registered trademark of FUJITSU LIMITED.

■ FEATURES

● **Clock**
  • Built-in oscillation circuit and PLL clock frequency multiplication circuit
  • Oscillation clock
  • The main clock is the oscillation clock divided into 2 (for oscillation 6 MHz : 3 MHz)
  • Clock for USB is 48 MHz
  • Machine clock frequency of 6 MHz, 12 MHz, or 24 MHz selectable
  • Minimum execution time of instruction : 41.6 ns (6 MHz oscillation clock, 4-time multiplied : machine clock 24 MHz and at operating V_{CC} = 3.3 V.

■ PACKAGES

120-pin Plastic LQFP   120-pin Plastic LQFP

(FPT-120P-M05)   (FPT-120P-M21)

FUJITSU
(Continued)

● **The maximum memory space : 16 MB**

● **24-bit addressing**

● **Bank addressing**

● **Instruction system**
- Data types : Bit, Byte, Word and Long word
- Addressing mode (23 types)
- Enhanced high-precision computing with 32-bit accumulator
- Enhanced Multiply/Divide instructions with sign and the RETI instruction

● **Instruction system compatible with high-level language (C language) and multi-task**
- Employing system stack pointer
- Instruction set symmetry and barrel shift instructions

● **Program Patch Function (2 address pointer)**

● **4-byte instruction queue**

● **Interrupt function**
- Priority levels are programmable
- 32 interrupts function

● **Data transfer function**
- Extended intelligent I/O service function (EI²OS) : Maximum of 16 channels
- μDMAC : Maximum 16 channels

● **Low Power Consumption Mode**
- Sleep mode (with the CPU operating clock stopped)
- Time-base timer mode (with the oscillator clock and time-base timer operating)
- Stop mode (with the oscillator clock stopped)
- CPU intermittent operation mode (with the CPU operating at fixed intervals of set cycles)
- Watch mode (with 32 kHz oscillator clock and watch timer operating)

● **Package**
- LQFP-120P (FPT-120P-M05 : 0.40 mm pin pitch)
- LQFP-120P (FPT-120P-M21 : 0.50 mm pin pitch)

● **Process : CMOS technology**

● **Operation guaranteed temperature : – 40 °C to + 85 °C (0 °C to + 70 °C when USB is in use)**

2

■ INTERNAL PERIPHERAL FUNCTION (RESOURCE)

• **I/O port : Max 94 ports**

• **Time-base timer : 1 channel**

• **Watchdog timer : 1 channel**

• **Watch timer : 1channel**

• **16-bit reload timer : 3 channels**

• **Multi-functional timer**
  • 16-bit free run timer : 1 channel
  • Output compare : 4 channels
    An interrupt request can be output when the 16-bit free-run timer value matches the compare register value.
  • Input capture : 4channels
    Upon detection of the effective edge of the signal input to the external input pin, the input capture unit sets the input capture data register to the 16-bit free-run timer value to output an interrupt request.
  • 8/16-bit PPG timer (8-bit × 6 channels or 16-bit × 3 channels) the period and duty of the output pulse can be set by the program.
  • 16-bit PWC timer : 1 channel
    Timer function and pulse width measurement function

• **UART : 4 channels**
  • Full-duplex double buffer (8-bit length)
  • Asynchronous transfer or clock-synchronous serial (I/O extended serial) transfer can be set.

• **I/O extended serial interface : 1 channel**

• **DTP/External interrupt circuit (8 channels)**
  • Activate the extended intelligent I/O service by external interrupt input
  • Interrupt output by external interrupt input

• **Delay interrupt output module**
  • Output an interrupt request for task switching

• **8/10-bit A/D converter : 16 channels**
  • 8-bit resolution or 10-bit resolution can be set.

• **USB : 1 channel**
  • USB function (conform to USB2.0 Full Speed)
  • Full Speed is supported/Endpoint are specifiable up to six.
  • Dual port RAM (The FIFO mode is supported).
  • Transfer type : Control, Interrupt, Bulk, or Isochronous transfer possible
  • USB Mini-HOST function

• **I²C* Interface : 3 channels**
  • Supports Intel SM bus standard and Phillips I²C bus standards
  • Two-wire data transfer protocol specification
  • Master and slave transmission/reception

* : I²C license :
  Purchase of Fujitsu I²C components conveys a license under the Philips I²C Patent Rights to use, these components in an I²C system provided that the system conforms to the I²C Standard Specification as defined by Philips.

MB90330 Series

■ PRODUCT LINEUP

Part number	MB90V330A	MB90F334A	MB90333A
Type	For evaluation	Built-in Flash memory	Built-in Mask ROM
ROM capacity	No	384 KB	256 KB
RAM capacity	28 KB	24 KB	16 KB
Emulator-specific power supply *	Used bit	—	
CPU functions	Number of basic instructions : 351 instructions Minimum instruction : 41.6 ns/at oscillation of 6 MHz execution time (When 4 times are used : Machine clock of 24 MHz) Addressing type : 23 types Program Patch Function : For 2 address pointers Maximum memory space : 16 MB		
Ports	I/O Ports (CMOS) 94 ports		
UART	Equipped with full-duplex double buffer Clock synchronous or asynchronous operation selectable It can also be used for I/O serial Built-in special baud-rate generator Built-in 4 channels		
16-bit reload timer	16-bit reload timer operation Built-in 3 channels		
Multi-functional timer	16-bit free run timer × 1 channel Output compare × 4 channels Input capture × 4 channels 8/16-bit PPG timer (8-bit mode × 6 channels, 16-bit mode × 3 channels) 16-bit PWC timer × 1 channel		
8/10-bit A/D converter	16 channels (input multiplex) 8-bit resolution or 10-bit resolution can be set. Conversion time : 7.16 μs at minimum (24 MHz machine clock at maximum)		
DTP/External interrupt	8 channels Interrupt factor : "L"→"H" edge/"H"→"L" edge/"L" level/"H" level selectable		
I²C	3 channels		
I/O extended serial interface	1 channel		
USB	1 channel USB function (conform to USB2.0 Full Speed) USB Mini-HOST function		
External bus interface	For multi-bus/non-multi-bus		
Withstand voltage of 5 V	16 ports (excluding VBUS and I/O for I²C)		
Low Power Consumption Mode	Sleep mode/Time-base timer mode/Stop mode/CPU intermittent mode/ Watch mode		
Process	CMOS		
Operating voltage	3.3 V ± 0.3 V (at maximum machine clock 24 MHz)		

* : It is setting of Jumper switch (TOOL VCC) when Emulator (MB2147-01) is used. Please refer to the
MB2147-01 or MB2147-20 hardware manual (3.3 Emulator-dedicated Power Supply Switching) about details.

■ PIN DESCRIPTION

Pin no. LQFP	Pin name	Circuit type*	Function
108, 107	X0, X1	A	Terminals to connect the oscillator. When connecting an external clock, leave the X1 pin side unconnected.
13, 14	X0A, X1A	A	32 kHz oscillation terminals.
90	$\overline{\text{RST}}$	F	External reset input pin.
93 to 100	P00 to P07	H	General purpose input/output port. The ports can be set to be added with a pull-up resistor (RD00 to RD07 = 1) by the pull-up resistor setting register (RDR0). (When the power output is set, it is invalid.)
	AD00 to AD07		Function as an I/O pin for the low-order external address and data bus in multiplex mode.
	D00 to D07		Function as an output pin for the low-order external data bus in non-multiplex mode.
101 to 104	P10 to P13	H	General purpose input/output port. The ports can be set to be added with a pull-up resistor (RD10 to RD13 = 1) by the pull-up resistor setting register (RDR1). (When the power output is set, it is invalid.)
	AD08 to AD11		Function as an I/O pin for the high-order external address and data bus in multiplex mode.
	D08 to D11		Function as an output pin for the high-order external data bus in non-multiplex mode.
109 to 112	P14 to P17	H	General purpose input/output port. The ports can be set to be added with a pull-up resistor (RD14 to RD17 = 1) by the pull-up resistor setting register (RDR1). (When the power output is set, it is invalid.)
	AD12 to D15		Function as an I/O pin for the high-order external address and data bus in multiplex mode.
	D12 to D15		Function as an output pin for the high-order external data bus in non-multiplex mode.
113 to 116	P20 to P23	D	This is a general purpose I/O port. When the bits of external address output control register (HACR) are set to "1" in external bus mode, these pins function as general purpose I/O ports.
	A16 to A19		When the bits of external address output control register (HACR) are set to "0" in multiplex mode, these pins function as address high output pins (A16 to A19).
	A16 to A19		When the bits of external address output control register (HACR) are set to "0" in non-multiplex mode, these pins function as address high output pins (A16 to A19).

(Continued)

7

Pin no.	Pin name	Circuit type*	Function
LQFP			
117 to 120	P24 to P27	D	This is a general purpose I/O port. When the bits of external address output control register (HACR) are set to "1" in external bus mode, these pins function as general purpose I/O ports.
	A20 to A23		When the bits of external address output control register (HACR) are set to "0" in multiplex mode, these pins function as address high output pins (A20 to A23).
	A20 to A23		When the bits of external address output control register (HACR) are set to "0" in non-multiplex mode, these pins function as address high output pins (A20 to A23).
	PPG0 to PPG3		Function as ch0 to ch3 output pins for the 8-bit PPG timer.
1	P30	D	General purpose input/output port.
	A00		Function as the external address pin in non-multi-bus mode.
	TIN1		Function as an event input pin for 16-bit reload timer ch1.
2	P31	D	General purpose input/output port.
	A01		Function as the external address pin in non-multi-bus mode.
	TOT1		Function as the output pin for 16-bit reload timer ch1.
3	P32	D	General purpose input/output port.
	A02		Function as the external address pin in non-multi-bus mode.
	TIN2		Function as an event input pin for 16-bit reload timer ch2.
4	P33	D	General purpose input/output port.
	A03		Function as the external address pin in non-multi-bus mode.
	TOT2		Function as the output pin for 16-bit reload timer ch2.
5 to 8	P34 to P37	D	General purpose input/output port.
	A04 to A07		Function as the external address pin in non-multi-bus mode.
9	P40	G	General purpose input/output port.
	A08		Function as the external address pin in non-multi-bus mode.
	TIN0		Function as an event input pin for 16-bit reload timer ch0.
10	P41	G	General purpose input/output port.
	A09		Function as the external address pin in non-multi-bus mode.
	TOT0		Function as the output pin for 16-bit reload timer ch0.
11	P42	G	General purpose input/output port.
	A10		Function as the external address pin in non-multi-bus mode.
	SIN0		Function as a data input pin for UART ch0.
12	P43	G	General purpose input/output port.
	A11		Function as the external address pin in non-multi-bus mode.
	SOT0		Function as a data output pin for UART ch0.
17	P44	G	General purpose input/output port.
	A12		Function as the external address pin in non-multi-bus mode.
	SCK0		Function as a clock I/O pin for UART ch0.

(Continued)

8

Pin no.	Pin name	Circuit type*	Function
LQFP			
18	P45	G	General purpose input/output port.
	A13		Function as the external address pin in non-multi-bus mode.
	SIN1		Function as a data input pin for UART ch1.
19	P46	G	General purpose input/output port.
	A14		Function as the external address pin in non-multi-bus mode.
	SOT1		Function as a data output pin for UART ch1.
20	P47	G	General purpose input/output port.
	A15		Function as the external address pin in non-multi-bus mode.
	SCK1		Function as a clock I/O pin for UART ch1.
81	P50	L	General purpose input/output port.
	ALE		Function as the address latch enable signal (ALE) pin in external bus mode.
82	P51	L	General purpose input/output port.
	$\overline{RD}$		Function as the read strobe output ($\overline{RD}$) pin in external bus mode.
83	P52	L	General purpose input/output port.
	$\overline{WRL}$		Function as the data write strobe output ($\overline{WRL}$) pin on the lower side in external bus mode. This pin functions as a general-purpose I/O port when the WRE bit in the EPCR register is "0".
84	P53	L	General purpose input/output port.
	$\overline{WRH}$		Function as the data write strobe output ($\overline{WRH}$) pin on the higher side in bus width 16-bit external bus mode. This pin functions as a general-purpose I/O port when the WRE bit in the EPCR register is "0".
85	P54	L	General purpose input/output port.
	HRQ		Function as the hold request input (HRQ) pin in external bus mode. This pin functions as a general-purpose I/O port when the HDE bit in the EPCR register is "0".
86	P55	L	General purpose input/output port.
	$\overline{HAK}$		Function as the hold acknowledge output ($\overline{HAK}$) pin in external bus mode. This pin functions as a general-purpose I/O port when the HDE bit in the EPCR register is "0".
91	P56	L	General purpose input/output port.
	RDY		Function as the external ready input (RDY) pin in external bus mode. This pin functions as a general-purpose I/O port when the RYE bit in the EPCR register is "0".
92	P57	L	General purpose input/output port.
	CLK		Function as the machine cycle clock output (CLK) pin in external bus mode. This pin functions as a general-purpose I/O port when the CKE bit in the EPCR register is "0".
21, 22	P60, P61	C	General purpose input/output port. (With stand voltage of 5 V)
	INT0, INT1		Function as external interrupt ch0 and ch1 input pins.

(Continued)

Pin no.	Pin name	Circuit type*	Function
LQFP			
23	P62	C	General purpose input/output ports. (Withstand voltage of 5 V)
	INT2		Function as an external interrupt ch2 input pin.
	SIN		Simple serial I/O data input pin.
24	P63	C	General purpose input/output port. (Withstand voltage of 5 V)
	INT3		Function as an external interrupt ch3 input pin.
	SOT		Simple serial I/O data output pin.
25	P64	C	General purpose input/output port. (Withstand voltage of 5 V)
	INT4		Function as an external interrupt ch4 input pin.
	SCK		Simple serial I/O clock input/output pin.
26	P65	C	General purpose input/output port. (Withstand voltage of 5 V)
	INT5		Function as an external interrupt ch5 input pin.
	PWC		Function as the PWC input pin.
27	P66	C	General purpose input/output port. (Withstand voltage of 5 V)
	INT6		Function as an external interrupt ch6 input pin.
	SCL0		Function as the ch0 clock I/O pin for the I^{2}C interface. Set port output to High-Z during I^{2}C interface operations.
28	P67	C	General purpose input/output port. (Withstand voltage of 5 V)
	INT7		Function as an external interrupt ch7 input pin.
	SDA0		Function as the ch0 data I/O pin for the I^{2}C interface. Set port output to High-Z during I^{2}C interface operations.
39 to 46	P70 to P77	I	General purpose input/output port.
	AN0 to AN7		Function as input pins for analog ch0 to ch7.
48 to 55	P80 to P87	I	General purpose input/output port.
	AN8 to AN15		Function as input pins for analog ch8 to ch15.
29	P90	D	General purpose input/output port.
	SIN2		Function as a data input pin for UART ch2.
30	P91	D	General purpose input/output port.
	SOT2		Function as a data output pin for UART ch2.
31	P92	D	General purpose input/output port.
	SCK2		Function as a clock I/O pin for UART ch2.
32	P93	D	General purpose input/output port.
	SIN3		Function as a data input pin for UART ch3.
33	P94	D	General purpose input/output port.
	SOT3		Function as a data output pin for UART ch3.
34	P95	D	General purpose input/output port.
	SCK3		Function as a clock I/O pin for UART ch3.
35	P96	C	General purpose input/output port. (Withstand voltage of 5 V)
	ADTG		Function as the external trigger input pin when the A/D converter is being used.
	FRCK		Function as the external clock input pin when the free-run timer is being used.

(Continued)

10

Pin no. LQFP	Pin name	Circuit type*	Function
56 to 59	PA0 to PA3	C	General purpose input/output port. (Withstand voltage of 5 V)
	IN0 to IN3		Function as the input capture ch0 to ch3 trigger inputs.
60 to 63	PA4 to PA7	C	General purpose input/output port. (Withstand voltage of 5 V)
	OUT0 to OUT3		Function as the output compare ch0 to ch3 event output pins.
64	PB0	C	General purpose input/output port. (Withstand voltage of 5 V)
	SCL1		Function as the ch1 clock I/O pin for the I^{2}C interface. Set port output to High-Z during I^{2}C interface operations.
65	PB1	C	General purpose input/output port. (Withstand voltage of 5 V)
	SDA1		Function as the ch1 data I/O pin for the I^{2}C interface. Set port output to High-Z during I^{2}C interface operations.
66	PB2	C	General purpose input/output port. (Withstand voltage of 5 V)
	SCL2		Function as the ch2 clock I/O pin for the I^{2}C interface. Set port output to High-Z during I^{2}C interface operations.
67	PB3	C	General purpose input/output port. (Withstand voltage of 5 V)
	SDA2		Function as the ch2 data I/O pin for the I^{2}C interface. Set port output to High-Z during I^{2}C interface operations.
68	PB4	C	General purpose input/output port. (Withstand voltage of 5 V)
69, 70	PB5, PB6	D	General purpose input/output port.
	PPG4, PPG5		Function as ch4 and ch5 output pins for the 8-bit PPG timer.
71	VBUS	C	Terminal for state detection of USB cable. (Withstand voltage of 5 V)
73	DVM	K	USB function D− pin.
74	DVP	K	USB function D+ pin.
77	HVM	K	USB Mini-HOST D− pin.
78	HVP	K	USB Mini-HOST D+ pin.
80	HCON	E	External pull-up resistor connect pin.
36	AVcc	—	A/D converter power supply pin.
37	AVRH	J	A/D converter external reference power supply pin.
38	AVss	—	A/D converter power supply pin.
87 to 89	MD2 to MD0	B	Operation mode select input pin.
15	Vcc	—	Power supply pin.
75	Vcc	—	Power supply pin.
79	Vcc	—	Power supply pin.
105	Vcc	—	Power supply pin.
16	Vss	—	Power supply pin (GND).
47	Vss	—	Power supply pin (GND).
72	Vss	—	Power supply pin (GND).
76	Vss	—	Power supply pin (GND).
106	Vss	—	Power supply pin (GND).

11

MB90330 Series

■ I/O CIRCUIT TYPE

Type	Circuit	Remarks
A	X1 / X1A / X0 / X0A — Clock input, Standby control signal	• High-rate oscillation feedback resistor, approx.1 MΩ • Low-rate oscillation feedback resistor, approx.10 MΩ • With standby control
B	Hysteresis input	• CMOS hysteresis input
C	Nch — Nout, Hysteresis input, Standby control signal	• CMOS hysteresis input • Nch open drain output
D	Pch — Pout, Nch — Nout, Hysteresis input, Standby control signal	• CMOS output • CMOS hysteresis input (With input interception function at standby) Notes : • Share one output buffer because both output of I/O port and internal resource are used. • Share one input buffer because both input of I/O port and internal resource are used.
E	Pch — Pout, Nch — Nout	• CMOS output
F	R, Hysteresis input	• CMOS hysteresis input with pull-up resistor

■ HANDLING DEVICES

1. Preventing latchup and turning on power supply

Latchup may occur on CMOS IC under the following conditions:

- If a voltage higher than V_{CC} or lower than V_{SS} is applied to input and output pins.
- A voltage higher than the rated voltage is applied between V_{CC} and V_{SS}.
- If the AV_{CC} power supply is turned on before the V_{CC} voltage.

Ensure that you apply a voltage to the analog power supply at the same time as V_{CC} or after you turn on the digital power supply (when you perform power-off, turn off the analog power supply first or at the same time as V_{CC} and the digital power supply).

If latch-up occurs, the supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Use meticulous care not to let any voltage exceed the maximum rating.

2. Treatment of unused pins

Leaving unused input pins unconnected can cause abnormal operation or latchup, leading to permanent damage. Unused input pins should always be pulled up or down through resistance of at least 2 kΩ. Any unused input/output pins may be set to output mode and left open, or set to input mode and treated the same as unused input pins. If there is unused output pin, make it to open.

3. Treatment of power supply pins on models with A/D converters

Even when the A/D converters are not in use, be sure to make the necessary connections $AV_{CC} = AVRH = V_{CC}$, and $AV_{SS} = V_{SS}$.

4. About the attention when the external clock is used
- Using external clock
5. Treatment of power supply pins (V_{CC}/V_{SS})

In products with multiple V_{CC} or V_{SS} pins, the pins of the same potential are internally connected in the device to avoid abnormal operations including latch-up. However, you must connect the pins to external power supply and a ground line to lower the electro-magnetic emission level, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with the V_{CC} and V_{SS} pins of this device at the low impedance.

It is also advisable to connect a ceramic bypass capacitor of approximately 0.1 µF between V_{CC} and V_{SS} near this device.

6. About Crystal oscillator circuit

Noise near the X0/X1 pins and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1 pins and X0A/X1A pins, the crystal oscillator (or the ceramic oscillator) and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended to design the PC board artwork with the X0/X1 pins and X0A/X1A pins surrounded by ground plane because stable operation can be expected with such a layout.

15

7. Caution on Operations during PLL Clock Mode

Even if the oscillator comes off or the clock input stops with the PLL clock selected for this microcontroller, the microcontroller may continue to operate at the free-running frequency of the PLL internal automatic oscillator circuit. Performance of this operation, however, cannot be guaranteed.

8. Stabilization of supply voltage

A sudden change in the supply voltage may cause the device to malfunction even within the V_{CC} supply voltage operating range. For stabilization reference, the supply voltage should be stabilized so that V_{CC} ripple variations (peak-to-peak value) at commercial frequencies (50 MHz to 60 MHz) fall below 10% of the standard V_{CC} supply voltage and the transient regulation does not exceed 0.1 V/ms at temporary changes such as power supply switching.

### 9. When the dual-supply is used as a single-supply device

If you are using only a single-system of the MB90330 series that come in the dual-system product, use it with X0A = VSS : X1A = OPEN.

10. Writing to flash memory

For serial writing to flash memory, always make sure that the operating voltage V_{CC} is between 3.13 V and 3.6 V.

For normal writing to flash memory, always make sure that the operating voltage V_{CC} is between 3.0 V and 3.6 V.

16

■ BLOCK DIAGRAM

* : Channel for use in 8-bit mode. 3 channels (ch1, ch3, ch5) are used in 16-bit mode.

Note : I/O ports share pins with peripheral function (resources) .
       For details, see "■ PIN ASSIGNMENT" and "■ PIN DESCRIPTION".
   Note also that pins used for peripheral function (resources) cannot serve as I/O ports.

Notes : • When the ROM mirror function register has been set, the mirror image data at higher addresses ("FF8000$_H$ to FFFFFF$_H$") of bank FF is visible from the higher addresses ("008000$_H$ to 00FFFF$_H$") of bank 00.
• The ROM mirror function is effective for using the C compiler small model.
• The lower 16-bit addresses of bank FF are equivalent to those of bank 00. Since the ROM area in bank FF exceeds 48 KB, however, the mirror image of all the data in the ROM area cannot be reproduced in bank 00.
• When the C compiler small model is used, the data table mirror image can be shown at "008000$_H$ to 00FFFF$_H$" by storing the data table at "FF8000$_H$ to FFFFFF$_H$". Therefore, data tables in the ROM area can be referred without declaring the far addressing with the pointer.

- Explanation on read/write

    R/W　: Readable and Writable

    R　　: Read only

    W　　: Write only

- Explanation on initial values

    0　　: Initial value is "0".

    1　　: Initial value is "1".

    X　　: Initial value is undefined.

    -　　: Initial value is undefined (None) .

    ∗　　: Initial value of this bit is "1" or "0".

Note : No I/O instruction can be used for registers located between 007900$_H$ and 007FFF$_H$.

(Continued)

(Continued)

◎ : Available, EI²OS stop function provided (The interrupt request flag is cleared by the interrupt clear signal. With a stop request).

○ : Available (The interrupt request flag is cleared by the interrupt clear signal.)

△ : Available when any interrupt source sharing ICR is not used.

× : Unavailable

* : If the same level interrupt is output simultaneously, the lower interrupt factor of interrupt vector number has priority.

Notes : • If the same interrupt control register (ICR) has two interrupt factors and the use of the EI²OS is permitted, the EI²OS is activated when either of the factors is detected. As any interrupt other than the activation factor is masked while the EI²OS is running, it is recommended that you should mask either of the interrupt requests when using the EI²OS.
  • The interrupt flag is cleared by the EI²OS interrupt clear signal for the resource that has two interrupt factors in the same interrupt control register (ICR).
  • If a resource has two interrupt sources for the same interrupt number, both of the interrupt request flags are cleared by the μDMAC interrupt clear signal. Therefore, when you use either of two interrupt factors for the DMAC function, another interrupt function is disabled. Set the interrupt request permission bit to "0" in the appropriate resource, and take measures by software polling.

■ PERIPHERAL RESOURCES

1. I/O port

The I/O ports are used as general-purpose input/output ports (parallel I/O ports). MB90330 series model is provided with 12 ports (94 inputs) . The ports function as input/output pins for peripheral functions also.

The port data register (PDR) can be used to send output data to the I/O pin and to receive the signal input to the I/O port. The port direction register (DDR) can be used to set the I/O direction of the I/O pin in bit units.

The following table lists the I/O ports and the peripheral functions with which they share pins.

	Port Pin Name	Pin Name (Peripheral)	Peripheral Function that Shares Pin
Port 0	P00 to P07	—	(External bus)
Port 1	P10 to P17	—	(External bus)
Port 2	P20 to P23	—	(External bus)
	P24 to P27	PPG0 to PPG3	8/16-bit PPG timer 0, 1 (External bus)
Port 3	P30 to P33	TIN1, TOT1, TIN2, TOT2	16-bit Reload timer 1, 2 (External bus)
	P34 to P37	—	(External bus)
Port 4	P40, P41	TIN0, TOT0	16-bit Reload timer 0 (External bus)
	P42 to P47	SIN0, SOT0, SCK0, SIN1, SOT1, SCK1	UART0, UART1 (External bus)
Port 5	P50 to P57	—	(External bus)
Port 6	P60, P61	INT0, INT1	External interrupt
	P62 to P64	INT2 to INT4, SIN, SOT, SCK	External interrupt, Serial I/O
	P65	INT5, PWC	External interrupt, PWC
	P66, P67	INT6, INT7, SCL0, SDA0	External interrupt, I^2C 0
Port 7	P70 to P77	AN0 to AN7	8/10-bit A/D converter
Port 8	P80 to P87	AN8 to AN15	8/10-bit A/D converter
Port 9	P90 to P95	SIN2, SOT2, SCK2, SIN3, SOT3, SCK3	UART2, 3
	P96	ADTG, FRCK	8/10-bit A/D converter, Free-run timer
Port A	PA0 to PA3	IN0 to IN3	Input capture 0, 1, 2, 3
	PA4 to PA7	OUT0 to OUT3	Output compare 0, 1, 2, 3
Port B	PB0 to PB3	SCL1, SDA1, SCL2, SDA2	I^2C 1, 2
	PB4	—	—
	PB5, PB6	PPG4, PPG5	PPG timer 2

Note : These pins also serve as the analog input pins for ports 7 and 8. To use them as general-purpose ports, be sure to set the corresponding bits in the analog input enable register (ADER) to 0_B. The ADER is initialized to FF_H at a reset.

* : R/W access to I/O ports is a bit different in behavior from R/W access to memory as follows :

    • Input mode

        Read : The level at the relevant pin is read.
        Write : Data is written to the output latch.

    • Output mode

        Read : The data register latch value is read.
        Write : Data is output to the relevant pin.

• When each pin is serving as a port, the corresponding pin is controlled as follows :

0 : Input mode

1 : Output mode

This bit becomes 0 after a reset.

Note : If these registers are accessed by a read modify write instruction (such as a bit set instruction) , the bits manipulated by the instruction are set to prescribed values but those other bits in output registers which have been set for input are rewritten to current input values of the pins. When switching a pin from input port to output port, therefore, write a desired value in the PDR first, then set the DDR to switch the pin for output.

35

• Register list (Analog input enable register)

ADER0	7	6	5	4	3	2	1	0	Initial Value	Access
Address : 00001E$_H$	ADE7	ADE6	ADE5	ADE4	ADE3	ADE2	ADE1	ADE0	11111111$_B$	R/W

Address : 00001F$_H$	ADE15	ADE14	ADE13	ADE12	ADE11	ADE10	ADE9	ADE8	11111111$_B$	R/W

This register controls the port 7, 8 pins as follows.

0 : Port input/output mode.
1 : Analog input mode.
This bit becomes 1 after a reset.

• Register list (Port pull-up resistance register)

RDR0	7	6	5	4	3	2	1	0	Initial Value	Access
Address : 00001C$_H$	RD07	RD06	RD05	RD04	RD03	RD02	RD01	RD00	00000000$_B$	R/W
RDR1	15	14	13	12	11	10	9	8		
Address : 00001D$_H$	RD17	RD16	RD15	RD14	RD13	RD12	RD11	RD10	00000000$_B$	R/W

Controls the pull-up resistor in input mode.

0 : Without pull-up resistor in input mode.

1 : With pull-up resistor in input mode.

Meaningless in output mode. (Without pull-up resistor)/The input/output mode is decided by the setting of the port direction register (DDR).

Without pull-up resistor is used in stop mode (SPL = 1). (High-Z) This function is disabled when the external bus is used. Do not attempt to write to this register.

• Register list (Output pin register)

ODR4	7	6	5	4	3	2	1	0	Initial Value	Access
Address : 00001B$_H$	OD47	OD46	OD45	OD44	OD43	OD42	OD41	OD40	00000000$_B$	R/W

Controls open-drain in output mode.

0 : Serves as a standard output port in output mode.

1 : Serves as an open-drain output port in output mode.

Meaningless in input mode (output High-Z)./The input/output mode is decided by the setting of the port direction register (DDR). This function is disabled when the external bus is used. Do not attempt to write to this register.

37
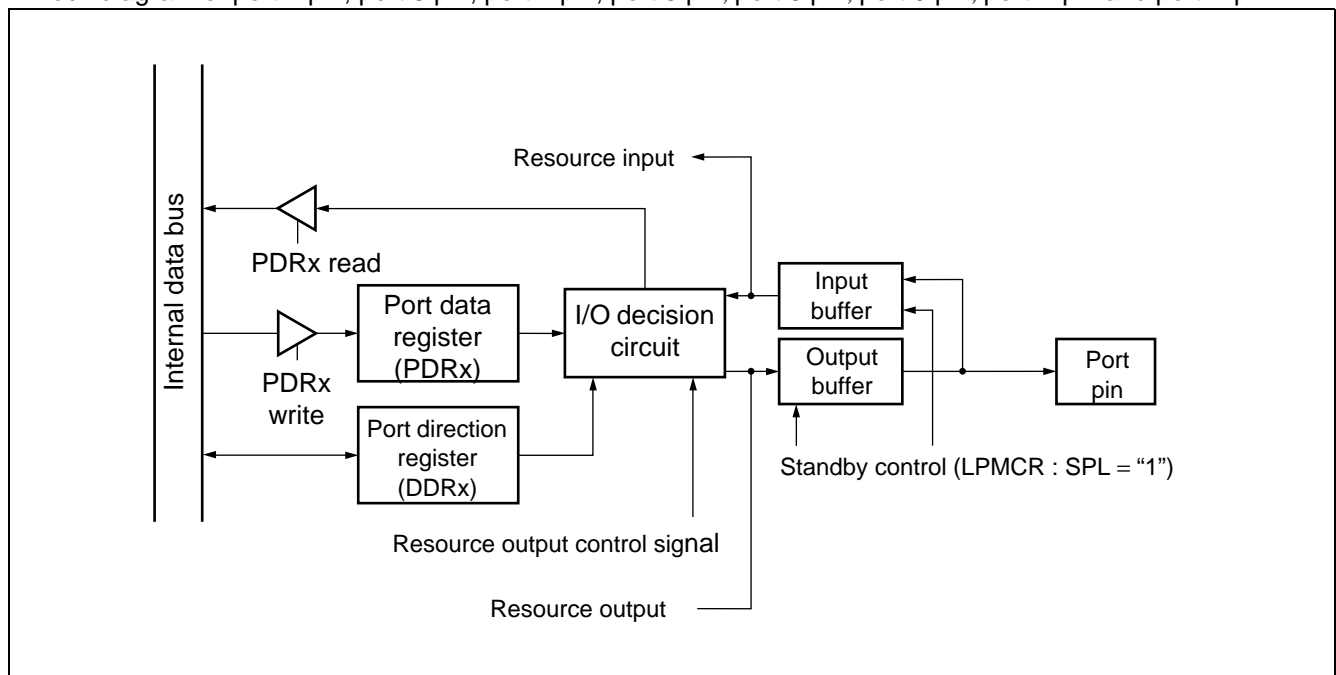

• Block diagram of port 7 pin and port 8 pin
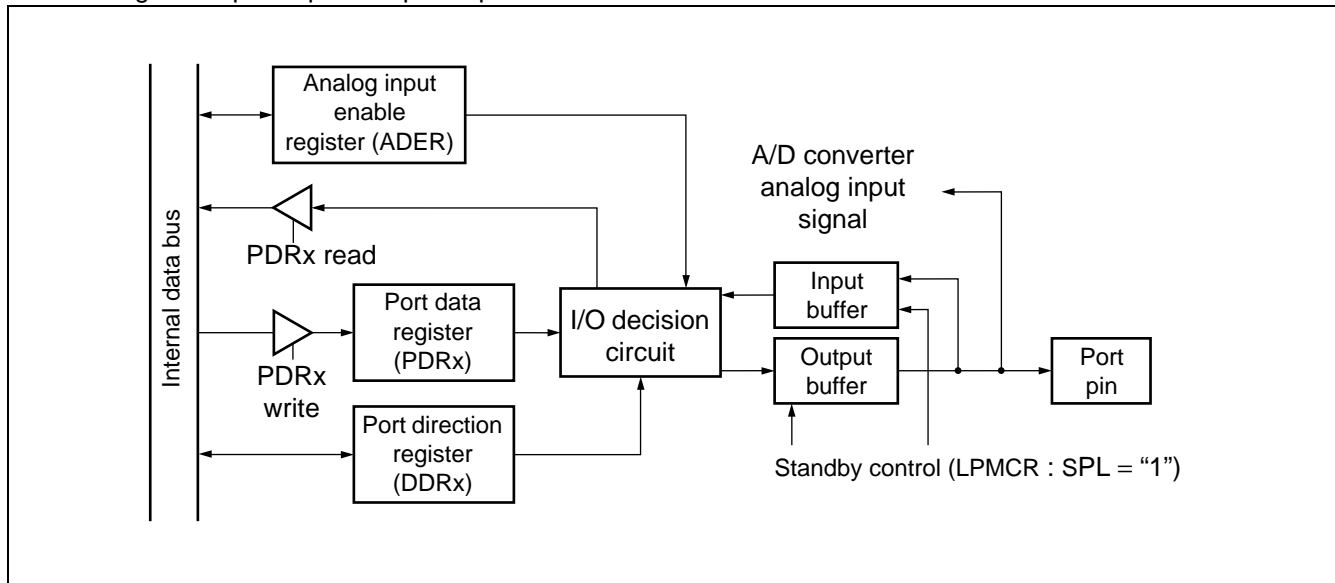

Notes : • When using as an input port, set " 0 " in the corresponding bit of the port-7 and port-8 direction register (DDR7 and DDR8) and " 0 " in the related bit of the analog input enable register (ADER).
  • When using as an analog input pin, set " 0 " in the corresponding bit of the port-7 and port-8 direction register (DDR7 and DDR8) and " 1 " in the related bit of the analog input enable register (ADER).

38

2. Time-base timer

The time-base timer is an 18-bit free-run counter (time-base timer counter) that counts in synchronization with the main clock (2 cycles of the oscillation clock HCLK). Four different time intervals can be selected, for each of which an interrupt request can be generated. Operating clock signals are supplied to peripheral resources such as the oscillation stabilization wait timer and watchdog timer.

● Interval time of time-base timer

Internal count clock cycle	Interval time
2/HCLK (0.33 µs)	2^{12}/HCLK (Approx. 0.68 ms)
	2^{14}/HCLK (Approx. 2.7 ms)
	2^{16}/HCLK (Approx. 10.9 ms)
	2^{19}/HCLK (Approx. 87.4 ms)

Notes : ● HCLK : Oscillation clock frequency
　　　　 ● The parenthesized values assume an oscillator clock frequency of 6 MHz.

● Clock cycles supplied from time-base timer

Where to supply clock	Clock cycle
Main clock oscillation stabilization wait	2^{13}/HCLK (Approx. 1.36 ms)
	2^{15}/HCLK (Approx. 5.46 ms)
	2^{17}/HCLK (Approx. 21.84 ms)
Watch dog timer	2^{12}/HCLK (Approx. 0.68 ms)
	2^{14}/HCLK (Approx. 2.7 ms)
	2^{16}/HCLK (Approx. 10.9 ms)
	2^{19}/HCLK (Approx. 87.4 ms)

Notes : ● HCLK : Oscillation clock frequency
　　　　 ● The parenthesized values assume an oscillator clock frequency of 6 MHz.

    Interrupt request number : #40 (28$_H$)

40

3.   Watchdog timer

The watchdog timer is timer counter provided for measure of program runaway. It is a 2-bit counter operating with an output of the timebase timer or watch timer as the count clock and resets the CPU when the counter is not cleared for a preset period of time after start.

● Interval time of watchdog timer

HCLK : Oscillation clock(6 MHz) SCLK : Sub clock(8 KHz)		
Min	**Max**	**Clock cycle**
Approx. 2.39 ms	Approx. 3.07 ms	$2^{14} \pm 2^{11}$/HCLK
Approx. 9.56 ms	Approx. 12.29 ms	$2^{16} \pm 2^{13}$/HCLK
Approx. 38.23 ms	Approx. 49.15 ms	$2^{18} \pm 2^{15}$/HCLK
Approx. 305.83 ms	Approx. 393.22 ms	$2^{21} \pm 2^{18}$/HCLK
Approx. 0.448 s	Approx. 0.576 s	$2^{12} \pm 2^{9}$/SCLK
Approx. 3.584 s	Approx. 4.608 s	$2^{15} \pm 2^{12}$/SCLK
Approx. 7.168 s	Approx. 9.216 s	$2^{16} \pm 2^{13}$/SCLK
Approx. 14.336 s	Approx. 18.432 s	$2^{17} \pm 2^{14}$/SCLK

Notes : • The maximum and minimum time intervals for the watchdog timer depend on the counter clear timing.
   • The watchdog timer contains a 2-bit counter that counts the carry-up signal from the time-base timer or watch timer.
   • Interval time of watchdog timer is longer than the set time during the following conditions.
       - When clearing the timebase timer during operation on oscillation (HCLK)
       - When clearing the watch timer during operation on sub clock (SCLK)

● Events that stop the watchdog timer
   • Stop due to a power-on reset
   • Watchdog reset

● Clear factor of watchdog timer
   • External reset input by $\overline{RST}$ pin
   • Writing "0" to the software reset bit
   • Writing "0" to the watchdog timer control bit (second and subsequent times)
   • Transition to sleep mode (clearing the watchdog timer to suspend counting)
   • Transition to time-base timer mode (clearing the watchdog timer to suspend counting)
   • Transition to stop mode (clearing the watchdog timer to suspend counting)

5. 16-bit reload timer

The 16-bit reload timer has the internal clock mode to decrement in synchronization with 3 different internal clocks and the event count mode to decrement upon detection of an arbitrary edge of the pulse input to the external pin. Either can be selected. This timer defines when the count value changes from 0000_H to $FFFF_H$ as an underflow. The timer therefore causes an underflow when the count reaches [reload register setting + 1]. Either mode can be selected for the count operation from the reload mode which repeats the count by reloading the count setting value at the underflow occurrence or the one-shot mode which stops the count at the underflow occurrence. The interrupt can be generated at the counter underflow occurrence so as to correspond to the DTC.

6. Multi function timer

The multi-function timer enables the following based on the 16-bit free-run timer.
• Output of independent waveform
• Measurement of input pulse width
• Measurement of external clock cycle

• Configuration of a multi-functional timer

16-bit free-run timer	16-bit Output Compare	16-bit Input Capture	8/16-bit PPG timer	16-bit PWC timer
1 channel	4 channels	4 channels	8-bit × 6 channels (16-bit × 3 channels)	1 channel

• 16-bit free-run timer : 1 channel

The 16-bit free-run timer consists of a 16-bit up counter (timer data register (TCDT)), compare clear register (CPCLR), timer control status register (TCCS), and prescaler.

The counter output value of the 16-bit free-run timer is used as the base timer for the output compare and input capture units.
• The count clock can be set, selected from among the following eight types.
  1/ϕ, 2/ϕ, 4/ϕ, 8/ϕ, 16/ϕ, 32/ϕ, 64/ϕ, 128/ϕ
  ϕ : Machine clock frequency
• During the following conditions, the interrupt should be output.
  - The counter value of 16-bit free run timer will be overflowed.
  - The counter value of 16-bit free run timer will be cleared after the counter value of 16-bit free run timer = the compare clear register value (CPCLR) (TCCS : ICRE = "1", MODE = "1")
• The counter value of 16-bit free run timer should be cleared to "0000$_H$" during the following conditions.
  • Reset
  • When setting the clear bit (SCLR) of timer control status register (TCCS) to "1"
  • When the counter value of the 16-bit free run timer = the compare clear register value (CPCLR) (TCCS : MODE = "1")
  • When setting "0000$_H$" to the timer data register (TCDT)

• Output compare : 4 channels

The output compare unit consists of compare registers (OCCP0 to OCCP3), compare control registers (OCS0 to OCS3), and a compare output latch.

The output compare unit can invert the output level and output an interrupt when a compare register (OCCP0 to OCCP3) value matches the counter value of the 16-bit free-run timer.
• Output compare registers can operate as 4 independent channels. The compare registers (OCCP0 to OCCP3) of each channel have interrupt request flags of their respective output pins.
• Pin output can be inverted by using 2 channels of compare registers (OCCP0 to OCCP3).
• If the counter value of 16-bit free run timer = the compare register (OCCP0 to OCCP3) (OCS0, OCS2 : IOP0 = "1", IOP1 = "1"), the interrupt request should be generated.
• The initial value for pin output of each channel can be set.

• Input capture : 4 channels

The input capture unit consists of the input capture data registers (IPCP0 to IPCP3) corresponding to external input pins (IN0 to IN3) and input capture control registers (ICS01, ICS23).

The input capture unit can capture the counter value of the 16-bit free-run timer into the input capture data register (IPCP0 to IPCP3) to generated an interrupt request upon detection of the effective edge of the signal input through the external input.

46

- The input capture unit in each channel can operate independently.
- The effective edge of the external signal can be selected (rising edge, falling edge, both edges).
- An interrupt request can be generated upon detection of the selected effective edge of the external signal.(ICS01, ICS2 : ICE0 = "1", ICE1 = "1", ICE2 = "1", ICE3 = "1").

* : Interrupt number
φ : Machine clock frequency
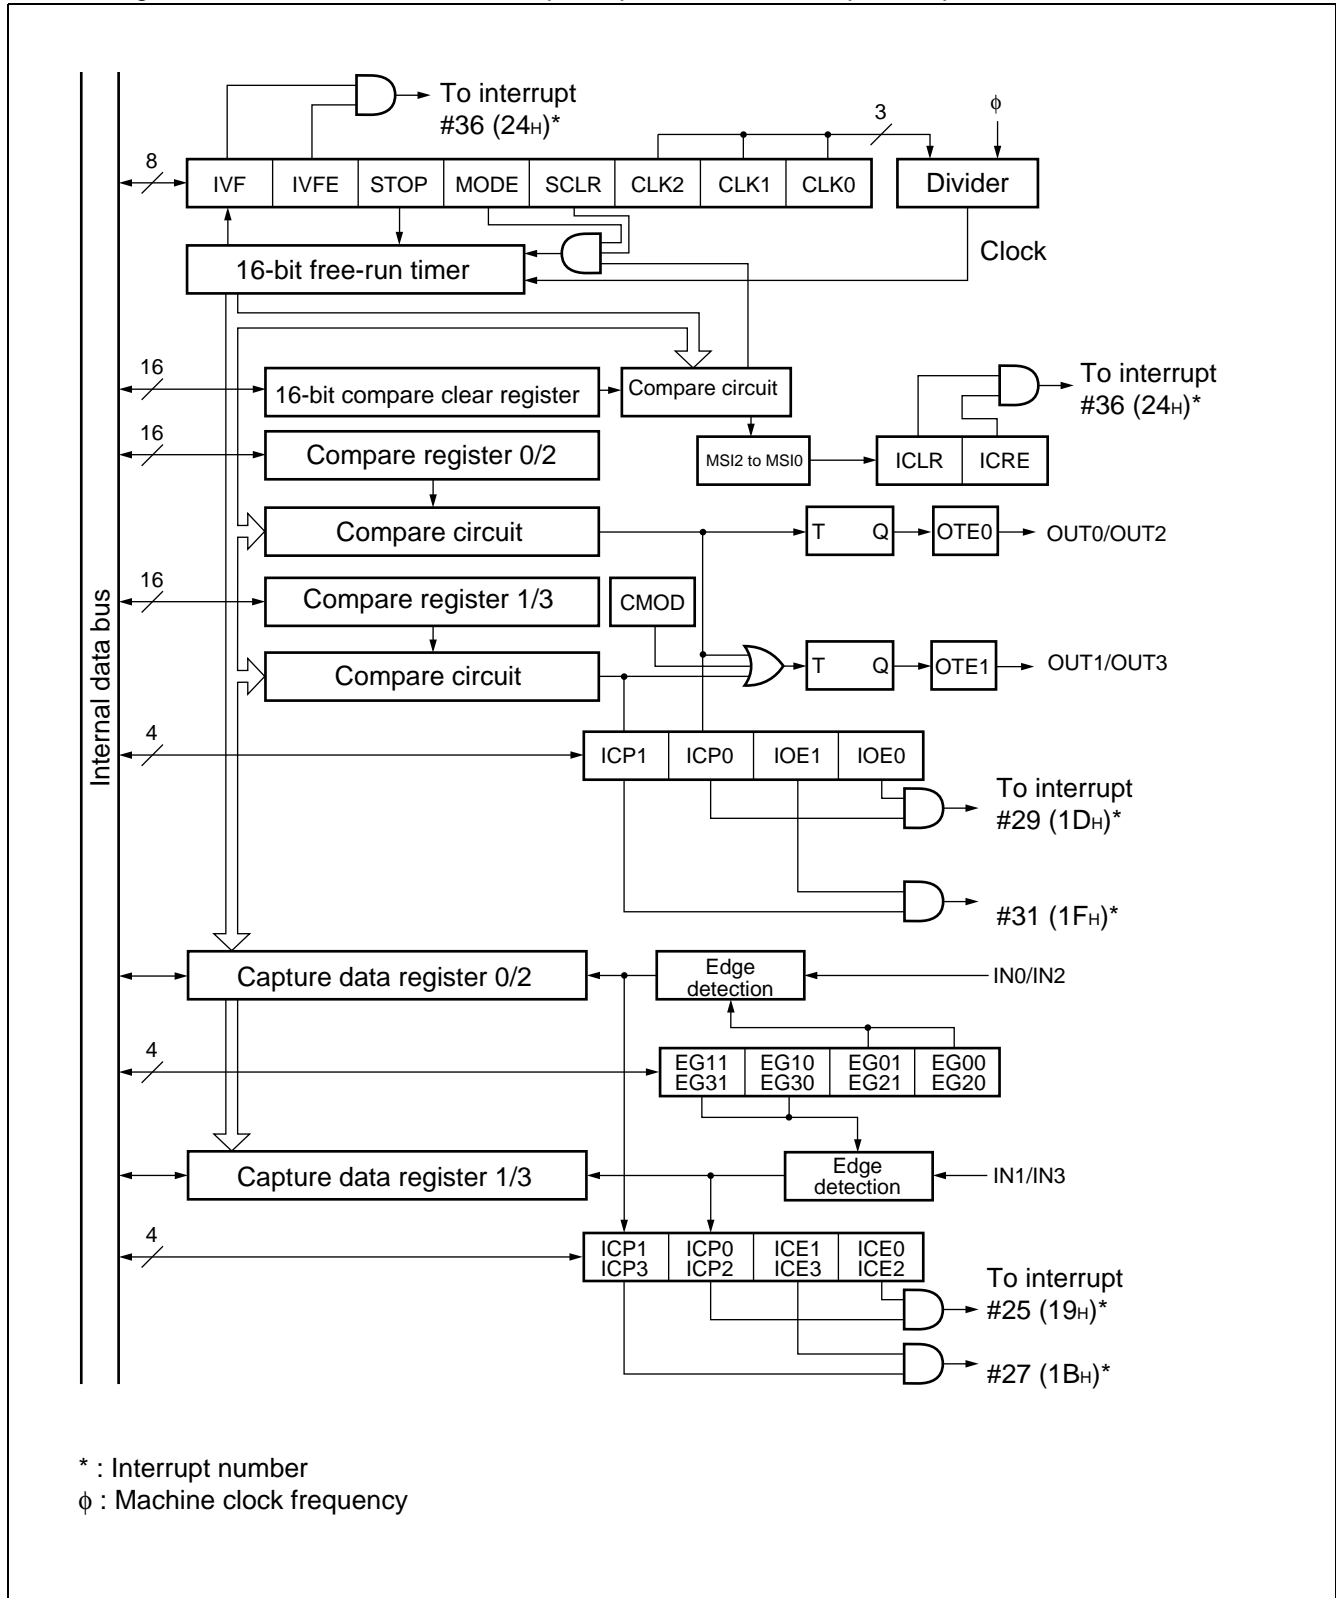

- 8/16-bit PPG timer (8-bit : 6 channels, 16-bit : 3 channels)

  8/16-bit PPG timer consists of an 8-bit down counter (PCNT), PPG control register (PPGC0 to PPGC5), PPG output control register (PPG01, PPG23, PPG45) and PPG reload register (PRLL0 to PRLL5, PRLH0 to PRLH5). When used as an 8-/16-bit reload timer, the PPG timer serves as an event timer. It can also output pulses of an arbitrary duty ratio at an arbitrary frequency.
  - 8-bit PPG mode
    Each channel operates as an independent 8-bit PPG.
  - 8-bit prescaler + 8-bit PPG mode
    Operates as an arbitrary-cycle 8-bit PPG with PPG0 (PPG2, PPG4) operating as an 8-bit prescaler and PPG1 (PPG3, PPG5) counted by the borrow output of PPG0 (PPG2, PPG4).
  - 16-bit PPG mode
    Operates as a 16-bit PPG with PPG0 (PPG2, PPG4) and PPG1 (PPG3, PPG5) connected.
  - PPG operation
    The PPG timer outputs pulses of an arbitrary duty ratio (the ratio between the High and Low level periods of pulse waveform) at an arbitrary frequency. This can also be used as a D/A converter by an external circuit.

• Block Diagram
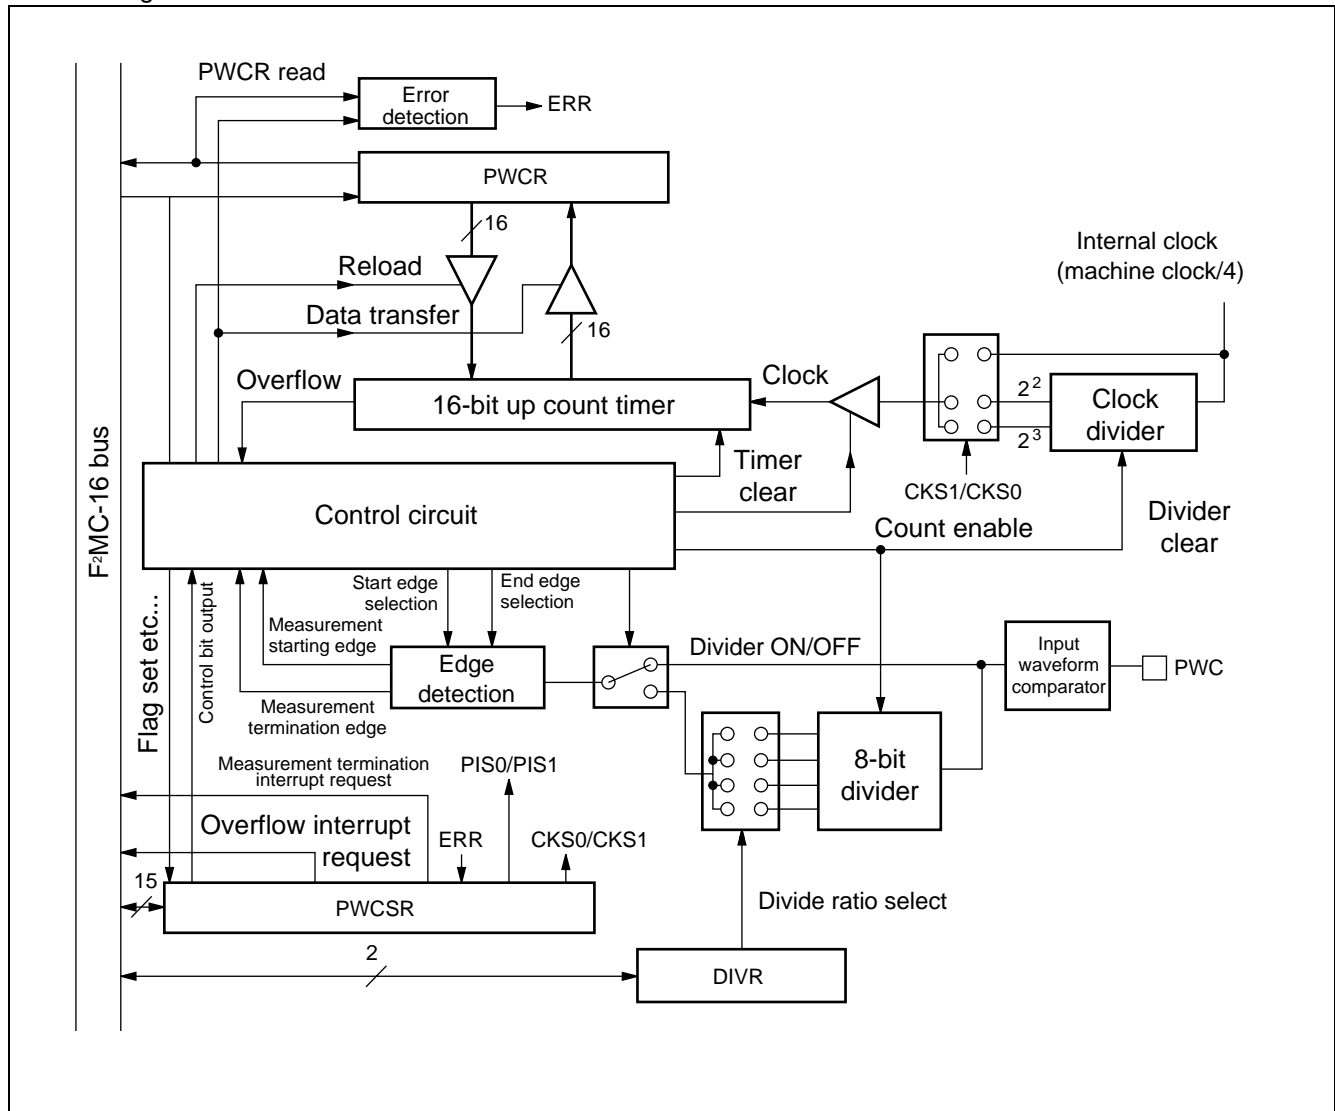

7. UART

UART is a general purpose serial communication interface for synchronous or asynchronous (start-stop synchronization) communications with external devices. It supports bi-directional communication (normal mode) and master/slave communication (multi-processor mode: supported on master side only). An interrupt can be generated upon completion of reception, detection of a reception error, or completion of transmission. EI^2OS is supported.

• UART functions

UART, or a generic serial data communication interface that sends and receives serial data to and from other CPU and peripherals, has the functions listed in following.

	Function
Data buffer	Full-duplex double-buffered
Transmission mode	• Clock synchronous (without start/stop bit) • Clock asynchronous (start-stop synchronous)
Baud rate	• Special-purpose baud-rate generator It is optional from 8 kinds. • Baud rate by external clock (SCK0/SCK1/SCK2/SCK3 terminal input)
Data length	• 8-bit or 7-bit (in the asynchronous normal mode only) • 1-bit to 8-bit (synchronous mode only)
Signal system	Non Return to Zero (NRZ) system
Reception error detection	• Framing error • Overrun error • Parity error (Not supported in operation mode 1)
Interrupt request	• Receive interrupt (reception completed, reception error detected) • Transmission interrupt (transmission completed) • Both the transmission and reception support EI^2OS.
Master/slave type communication function (multi processor mode)	Capable of 1 (master) to many (slaves) communication (available just as master)

Note : In clock synchronous transfer mode, the UART transfers only data with no start or stop bit added.

• UART operation modes

Operation mode		Data length		Synchronization	Stop bit length
		Without parity	With parity		
0	Normal mode	7-bit or 8-bit		Asynchronous	1-bit or 2-bit *2
1	Multi processor mode	8-bit + 1*1	—	Asynchronous	
2	Normal mode	1 to 8-bit	—	Synchronous	No

— : Setting disabled

*1 : + 1 is an address/data setting bit (A/D) which is used for communication control.

*2 : Only one bit can be detected as a stop bit at reception.

8. Extended I/O serial interface

The extended I/O serial interface is a serial I/O interface in an 8-bit, single-channel, capable of clock synchronous data transfer. LSB-first or MSB-first transfer mode can be selected for data transfer.

There are 2 serial I/O operation modes available:
- Internal shift clock mode: Transfer data in synchronization with the internal clock.
- External shift clock mode: Transfer data in synchronization with the clock supplied via the external pin (SCK). By manipulating the general-purpose port sharing the external pin (SCK) in this mode, data can also be transferred by a CPU instruction.

9. I²C Interface

The I²C interface is a serial I/O port supporting the Inter IC BUS. It serves as a master/slave device on the I²C bus and has the following features.

- Master/slave sending and receiving
- Arbitration function
- Clock synchronization function
- Slave address and general call address detection function
- Detecting transmitting direction function
- Start condition repeated generation and detection function
- Bus error detection function

10. USB Function

The USB function is an interface supporting the USB (Universal Serial Bus) communications protocol.

- Feature of USB function
  - Conform to USB2.0 Full Speed
  - Full speed (12 Mbps) is supported.
  - The device status is auto-answer.
  - Bit stripping, bit stuffing, and automatic generation and check of CRC5 and CRC16
  - Toggle check by data synchronization bit
  - Automatic response to all standard commands except Get/SetDescriptor and SynchFrame commands (these 3 commands can be processed the same way as the class vendor commands).
  - The class vendor commands can be received as data and responded via firmware.
  - Supports up to 6 EndPoints (EndPoint0 is fixed to control transfer)
  - 2 transfer data buffers integrated for each end point (one IN buffer and one OUT buffer for EndPoint 0)
  - Supports automatic transfer mode for transfer data via DMA (except buffers for EndPoint 0)
  - Capable of detection of connection and disconnection by monitoring the USB bus power line

11. USB Mini-HOST

USB Mini-HOST provides minimal host operations required and is a function that enables data to be transferred to and from Device without PC intervention.

• Feature of USB Mini-HOST
- Automatic detection of Low Speed/Full Speed transfer
- Low Speed/Full Speed transfer support
- Automatic detection of connection and cutting device
- Reset sending function support to USB-bus
- Support of IN/OUT/SETUP/SOF token
- In-token handshake packet automatic transmission (excluding STALL)
- Out-token handshake packet automatic detection
- Supports a maximum packet length of 256 bytes.
- Error (CRC error/toggle error/time-out) various supports
- Wake-Up function support

• Differences between the USB HOST and USB Mini-HOST

		HOST	Mini-HOST
Hub support		○	×
Transfer	Bulk transfer	○	○
	Control transfer	○	○
	Interrupt transfer	○	○
	ISO transfer	○	×
Transfer speed	Low Speed	○	○
	Full Speed	○	○
PRE packet support		○	×
SOF packet support		○	○
Error	CRC error	○	○
	Toggle error	○	○
	Time-out	○	○
	Maximum packet < receive data	○	○
Detection of connection and cutting of device		○	○
Transfer speed detection		○	○

○ : Supported
× : Not supported

12. 8/10-bit A/D converter

The A/D converter converts analog input voltages into digital values and has the following features.
- RC sequential compare conversion method with sample and hold circuit
- Selectable 8-bit resolution or 10-bit resolution
- Analog input program-selectable from among 16 channels

Single conversion mode : Convert 1 selected channel

Scan conversion mode : Continuous plural channels (maximum 16 channels can be programmed) are converted.

Continuous conversion mode : Repeatedly convert the specified channels.

Stop conversion mode: Convert 1 channel then suspend conversion to remain on standby until the next activation. (Simultaneous conversion start available.)
- An interrupt request to the CPU can be generated upon completion of A/D conversion. Suitable for continuous processing as this interrupt activates μDMA to transfer the data resulting from A/D conversion to memory.
- The activation source can be selected from among software, external trigger (falling edge), and timer (rising edge).

• Block Diagram
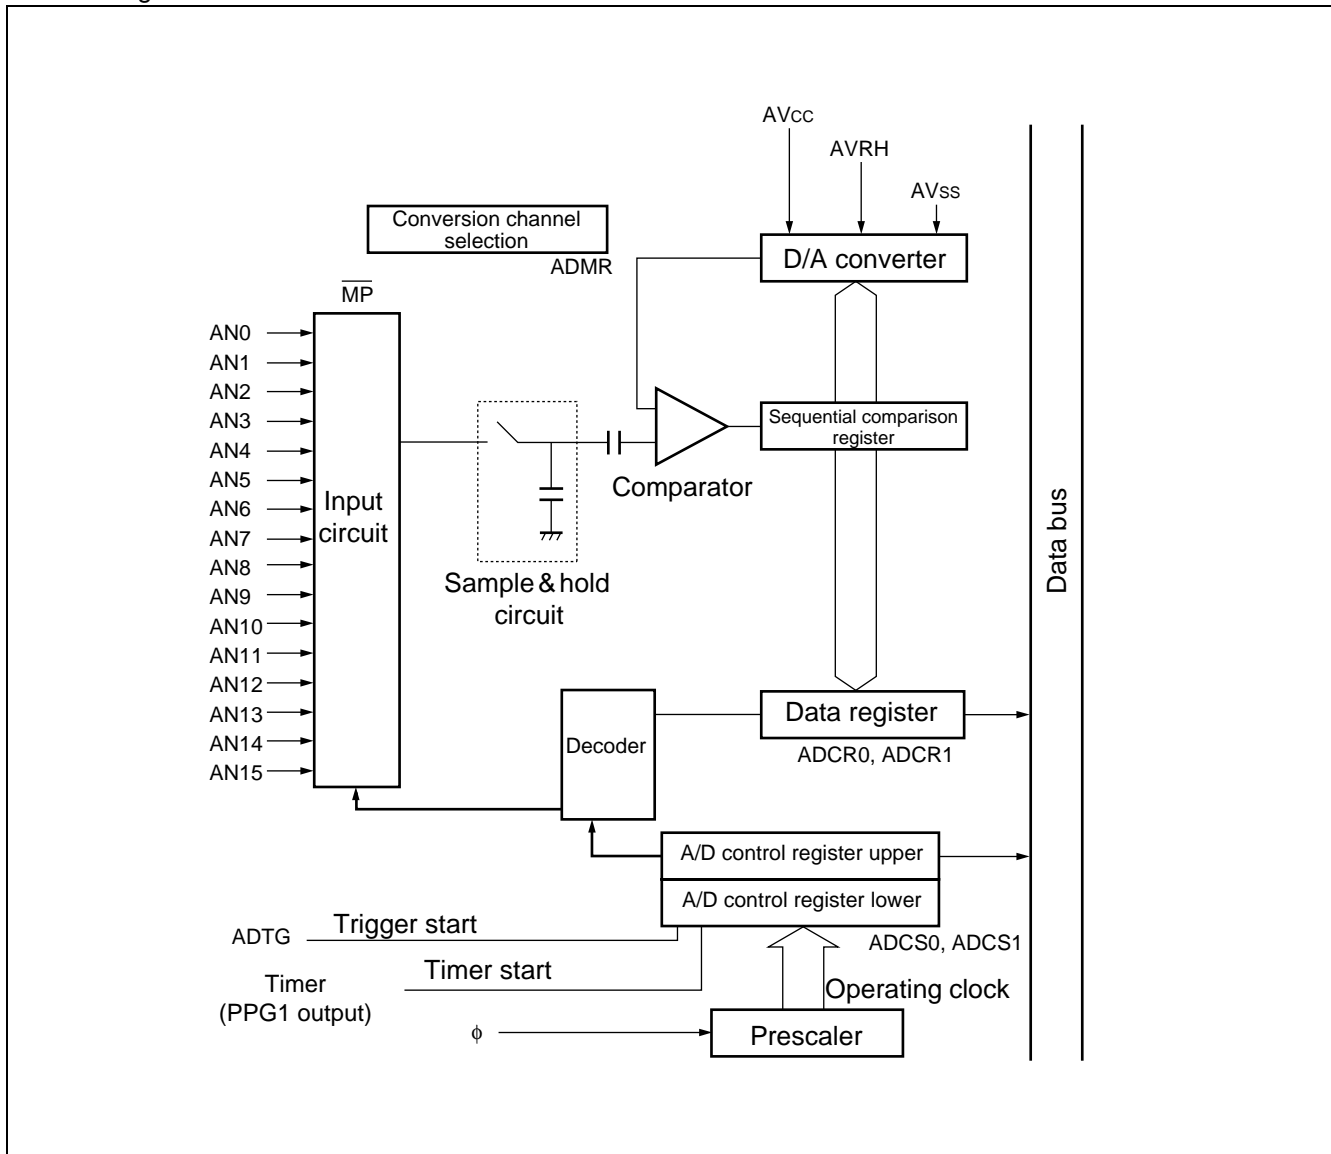

13. DTP/External interrupt circuit

DTP (Data Transfer Peripheral)/External interrupt circuit detects the interrupt request input from the external interrupt input terminal (INT7 to INT0) , and outputs the interrupt request.

• DTP/External interrupt circuit function

The DTP/External interrupt function outputs an interrupt request upon detection of the edge or level signal input to the external interrupt input pins (INT7 to INT0).

If CPU accepts the interrupt request, and if the extended intelligent I/O service (EI^{2}OS) is enabled, branches to the interrupt handling routine after completing the automatic data transfer (DTP function) performed by EI^{2}OS. And if EI^{2}OS is disabled, it branches to the interrupt handling routine without activating the automatic data transfer (DTP function) performed by EI^{2}OS.

• Overview of DTP/External interrupt circuit

	External interrupt	DTP function
Input pin	8 channels (P60/INT0, P61/INT1, P62/INT2/SIN, P63/INT3/SOT, P64/INT4/SCK, P65/INT5/PWC, P66/INT6/SCL0, P67/INT7/SDA0)	
Interrupt source	The detection level or the type of the edge for each terminal can be set in the request level setting register (ELVR).	
	Input of H level/L level/rising edge/falling edge.	
Interrupt number	#18 (12$_H$), #20 (14$_H$), #22 (16$_H$), #24 (18$_H$)	
Interrupt control	Enabling/disabling the interrupt request output using the DTP/interrupt enable register (ENIR)	
Interrupt flag	Holding the interrupt causes using the DTP/interrupt cause register (EIRR)	
Process setting	Disable EI^{2}OS (ICR: ISE="0")	Enable EI^{2}OS (ICR: ISE="1")
Process	Branched to the interrupt handling routine	After an automatic data transfer by EI^{2}OS, branched to the interrupt handling routine

• Block Diagram

15. μDMAC
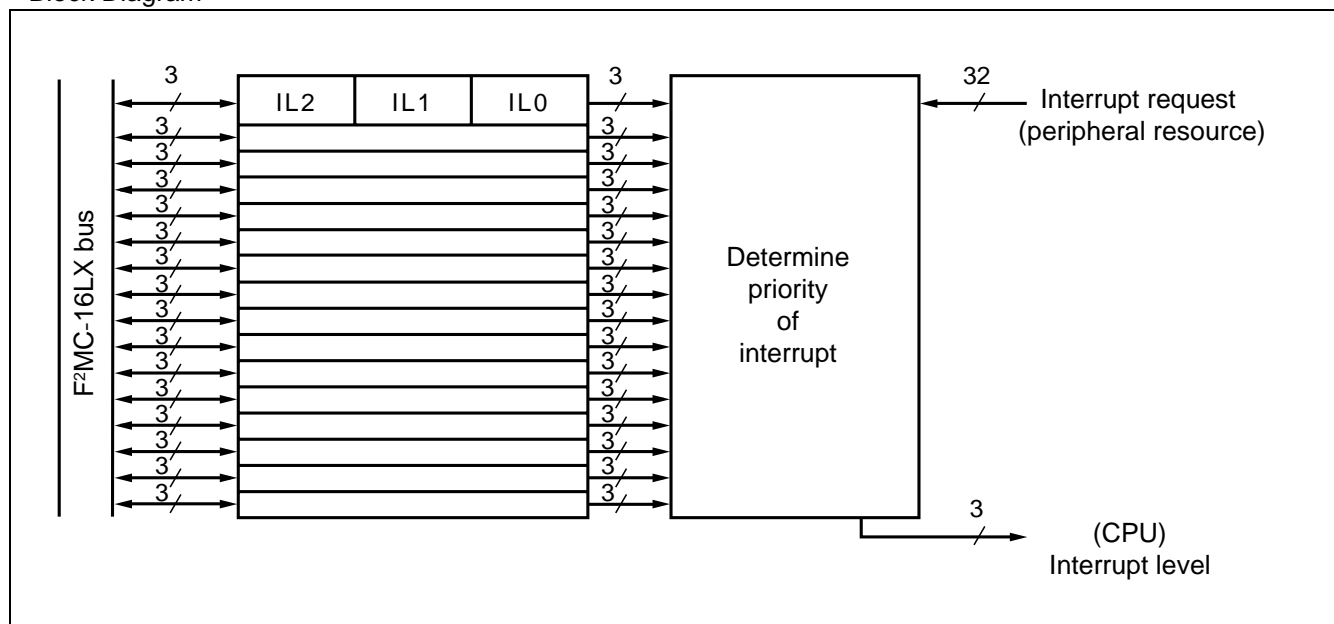

μDMAC is simple DMA with the function equal with EI²OS. It has 16 channels DMA transfer channels with the following features.
- Performs automatic data transfer between the peripheral resource (I/O) and memory
- The program execution of CPU stops in the DMA start-up
- Capable of selecting whether to increment the transfer source and destination addresses
- DMA transfer is controlled by the DMA enable register, DMA stop status register, DMA status register, and descriptor.
- A STOP request is available for stopping DMA transfer from the resource.
  Upon completion of DMA transfer, the flag bit corresponding to the transfer completed channel in the DMA status register is set and a termination interrupt is output to the transfer controller.

17. Address matching detection function

When the address is equal to the value set in the address detection register, the instruction code to be read into the CPU is forcibly replaced with the INT9 instruction code (01$_H$). As a result, the CPU executes the INT9 instruction when executing the set instruction. By performing processing by the INT#9 interrupt routine, the program patch function is enabled.

2 address detection registers are provided, for each of which there is an interrupt enable bit. When the address matches the value set in the address detection register with the interrupt enable bit set to 1, the instruction code to be read into the CPU is forcibly replaced with the INT9 instruction code.

18. Delay interrupt generator module

The delay interrupt generation module is a module that generates interrupts for switching tasks. A hardware interrupt can be generated by software.

• **Delay interrupt generator module function**

	Function and control
Interrupt source	• Setting the R0 bit in the delayed interrupt request generation/release register to 1 (DIRR: R0 = 1) generates a delayed interrupt request. • Setting the R0 bit in the delayed interrupt request generation/release register to 0 (DIRR: R0 = 0) cancels the delayed interrupt request.
Interrupt control	No setting of permission register is provided.
Interrupt flag	Set in bit R0 of the delayed interrupt request generation /clear register (DIRR : R0)
EI^{2}OS support	Not ready for extended intelligent I/O service (EI^{2}OS).

• Block Diagram
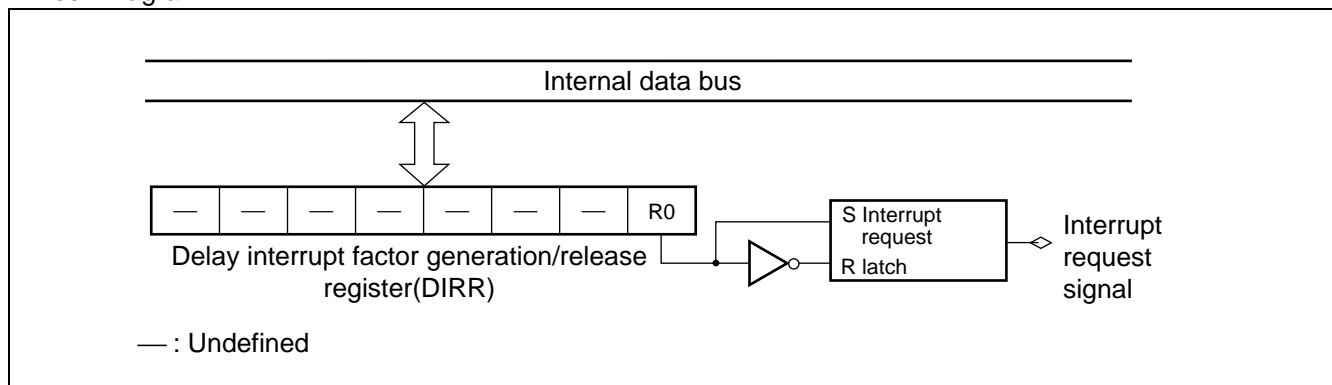

19. ROM mirror function selection module

The ROM mirror function select module can make a setting so that ROM data located in bank FF can be read by accessing bank 00.

• ROM mirroring function selection module function

	Description
Mirror setting address	FFFFFF$_H$ to FF8000$_H$ in the FF bank can be read through 00FFFF$_H$ to 008000$_H$ in the 00 bank.
Interrupt source	None.
EI²OS support	Not ready for extended intelligent I/O service (EI²OS) .

• Block Diagram
20. Low power consumption (standby) mode

The F²MC-16LX can be set to save power consumption by selecting and setting the low power consumption mode.

• CPU operation mode and functional description

CPU operating clock	Operation mode	Description
PLL clock	Normal run	The CPU and peripheral resources operate at the clock frequency obtained by PLL multiplication of oscillator clock (HCLK) frequency.
	Sleep	Only peripheral resources operate at the clock frequency obtained by PLL multiplication of the oscillator clock (HCLK) .
	Time-base timer	Only the time-base timer operates at the clock frequency obtained by PLL multiplication of the oscillator clock (HCLK) frequency.
	Stop	The CPU and peripheral resources are suspended with the oscillator clock stopped.
Main clock	Normal run	The CPU and peripheral resources operate at the clock frequency obtained by dividing the oscillator clock (HCLK) frequency by two.
	Sleep	Only peripheral resources operate at the clock frequency obtained by dividing the oscillator clock (HCLK) frequency by two.
	Time-base timer	Only the time-base timer operates at the clock frequency obtained by dividing the oscillator clock (HCLK) frequency by two.
	Stop	The CPU and peripheral resources are suspended with the oscillator clock stopped.
Sub clock	Normal run	The CPU and peripheral resources operate at the clock frequency obtained by dividing the subclock (SCLK) frequency by four.
	Sleep	Only peripheral resources operate at the clock frequency obtained by dividing the subclock (SCLK) frequency by four.
	Watch mode	Only the watch timer operates at the clock frequency obtained by dividing the subclock (SCLK) frequency by four.
	Stop	The CPU and peripheral resources are suspended with the subclock stopped.
CPU intermittent operation mode	Normal run	The halved or PLL-multiplied oscillator clock (HCLK) frequency or the subclock (SCLK) frequency is used for operation while being decimated in a certain period.

21. Clock

The clock generator controls the internal clock as the operating clock for the CPU and peripheral resources. The internal clock is referred to as machine clock whose one cycle is defined as machine cycle. The clock based on source oscillation is referred to as oscillator clock while the clock based on internal PLL oscillation is referred to as PLL clock.

22. 3 Mbits flash memory

The description that follows applies to the flash memory built in the MB90F334A; it is not applicable to evaluation ROM or masked ROM.

The flash memory is located in bank FF in the CPU memory map.

• Function to flash memory

	Description
Memory capacity	3072 Kbits (384 KB)
Memory configuration	384 Kwords × 8 bits/192 Kwords × 16 bits
Sector configuration	64 KB × 5 + 32 KB + 8 KB × 2 + 16 KB
Sector protect function	Possibility that set up with a recommendation parallel writer
Program algorithm	Automatic program algorithm (Embedded Algorithm* : Similar to MBM29LV400TC)
Operation command	• Compatibility with the JEDEC standard-type command • Built-in deletion pause/deletion resume function • Detection of programming/erasure completion using data polling and the toggle bit • Capable of erasing data sector by sector (in arbitrary combination of sectors)
Program/Erase cycle	At least 10,000 times guaranteed

How to program and erase memory	• Parallel programmer available for programming and erasure
	  (Ando Denki : AF9708, AF9709, AF9709B)
	• Can be written and erased using a dedicated serial writer
	  (Yokogawa Digital Computer Corporation : AF220/AF210/AF120/AF110)
	• Write/delete operation by program execution

Interrupt source	Programming/erasure completion sources
EI²OS supports	Not ready for expanded intelligent I/O service (EI²OS).

* : Embedded Algorithm is a trade mark of Advanced Micro Devices Inc.

• Sector configuration of flash memory

Flash Memory   CPU address   Writer address *

Flash Memory	CPU address	Writer address *
Prohibited	F80000$_H$ F8FFFF$_H$	00000$_H$ 0FFFF$_H$

- Standard configuration for Fujitsu standard serial on-board writing

    The flash microcontroller programmer (AF220/AF210/AF120/AF110) made by Yokogawa Digital Computer Corporation is used for Fujitsu standard serial on-board writing.

Host interface cable (AZ201)

General-purpose common cable (AZ210)

RS232C

Flash microcontroller programmer + Memory card

CLK synchronous serial

MB90F334A user system

Can operate stand alone
Note : Inquire of Yokogawa Digital Computer Corporation for details about the functions and operations of the AF220, AF210, AF120 and AF110 flash microcontroller programmer, general-purpose common cable for connection (AZ210) and connectors.

- Pins Used for Fujitsu Standard Serial On-board Programming

Pin	Function	Description
MD2, MD1, MD0	Mode input pin	The device enters the serial program mode by setting MD2=1, MD1=1 and MD0 =0.
X0, X1	Oscillation pin	Because the internal CPU operation clock is set to be the 1 multiplication PLL clock in the serial write mode, the internal operation clock frequency is the same as the oscillation clock frequency.
P60, P61	Programming program start pins	Input a Low level to P60 and a High level to P61.
$\overline{RST}$	Reset input pin	—
SIN0	Serial data input pin.	UART0 is used as CLK synchronous mode. In program mode, the pins used for the UART0 CLK synchronous mode are SIN0, SOT0 and SCK0.
SOT0	Serial data output pin	
SCK0	Serial clock input pin	
V_{CC}	Power source input pin	When supplying the write voltage (MB90F334A : 3.3 V $\pm$ 0.3 V) from the user system, connection with the flash microcontroller programmer is not necessary. When connecting, do not short-circuit with the user power supply.
V_{SS}	GND Pin	Share GND with the flash microcontroller programmer.

86

The control circuit shown in the figure is required for using the P60, P61, SIN0, SOT0 and SCK0 pins on the user system. Isolate the user circuit during serial on-board writing, with the TICS signal of the flash microcontroller programmer.

AF220/AF210/AF120/AF110 program control pin

AF220/AF210/AF120/AF110/ TICS pin

10 kΩ

MB90F334A program control pin

User
Control circuit

The MB90F334A serial clock frequency that can be input is determined by the following expression:
Use the flash microcontroller programmer to change the serial clock input frequency setting depending on the oscillator clock frequency to be used.

Inputable serial clock frequency = 0.125 × oscillation clock frequency.

• Maximum serial clock frequency

Oscillation clock frequency	Maximum serial clock frequency acceptable to the microcontroller	Maximum serial clock frequency that can be set with the AF220, AF210, AF120 or AF110	Maximum serial clock frequency that can be set with the AF200
At 6 MHz	750 kHz	500 kHz	500 kHz

• System configuration of the flash microcontroller programmer (AF220/AF210/AF120/AF110) (made by Yokogawa Digital Computer Corporation)

Part number		Function
Unit	AF220/AC4P	Model with internal Ethernet interface /100 V to 220 V power adapter
	AF210/AC4P	Standard model /100 V to 220 V power adapter
	AF120/AC4P	Single key internal Ethernet interface mode /100 V to 220 V power adapter
	AF110/AC4P	Single key model /100 V to 220 V power adapter
AZ221		PC/AT RS232C cable for writer
AZ210		Standard target probe (a) length : 1 m
FF201		Control module for Fujitsu F^{2}MC-16LX flash microcontroller control module
AZ290		Remote controller
/P4		4 MB PC Card (option) Flash memory capacity to 512 KB correspondence

Contact to : Yokogawa Digital Computer Corporation TEL : 81-423-33-6224

Note : The AF200 flash microcontroller programmer is a retired product, but it can be supported using control module FF201.

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	
	AV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	$V_{CC} \geq AV_{CC}$*2
	AVRH	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	$AV_{CC} \geq AVR \geq 0$ V*3
Input voltage*1	V_I	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*4
		$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	Nch open-drain (Withstand voltage of 5 V I/O)*5
		$- 0.5$	$V_{SS} + 4.5$	V	USB I/O
Output voltage*1	V_O	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*4
		$- 0.5$	$V_{SS} + 4.5$	V	USB I/O
Maximum clamp current	I_{CLAMP}	$- 2.0$	$+2.0$	mA	*6
Total maximum clamp current	$\Sigma \mid I_{CLAMP} \mid$	—	20	mA	*6
"L" level maximum output current	I_{OL1}	—	10	mA	Other than USB I/O*7
	I_{OL2}	—	43	mA	USB I/O*7
"L" level average output current	I_{OLAV}	—	3	mA	*8
"L" level maximum total output current	ΣI_{OL}	—	60	mA	
"L" level average total output current	ΣI_{OLAV}	—	30	mA	*9
"H" level maximum output current	I_{OH1}	—	$- 10$	mA	Other than USB I/O*7
	I_{OH2}	—	$- 43$	mA	USB I/O*7
"H" level average output current	I_{OHAV}	—	$- 3$	mA	*8
"H" level maximum total output current	ΣI_{OH}	—	$- 60$	mA	
"H" level average total output current	ΣI_{OHAV}	—	$- 30$	mA	*9
Power consumption	Pd	—	340	mW	
Operating temperature	T_A	$- 40$	$+ 85$	°C	
Storage temperature	Tstg	$- 55$	$+ 150$	°C	
		$- 55$	$+ 125$	°C	USB I/O

*1 : The parameter is based on $V_{SS} = AV_{SS} = 0.0$ V.

*2 : Be careful not to let AV_{CC} exceed V_{CC}, for example, when the power is turned on.

*3 : Be careful not to let AVRH exceed AVcc.

*4 : V_I and V_O must not exceed Vcc + 0.3 V. However, if the maximum current to/from an input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating.

*5 : Applicable to pins : P60 to P67, P96, PA0 to PA7, PB0 to PB4, VBUS

*6 : • Applicable to pins: P00 to P07, P10 to P17, P20 to P27, P30 to P37, P40 to P47, P50 to P57, P70 to P77, P80 to P87, P90 to P95, PB5, PB6
   • Use within recommended operating conditions.
   • Use at DC voltage (current)
   • The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.

88

- The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V_{CC} pin, and this may affect other devices.
- Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V) , the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the power-on reset.
- Care must be taken not to leave the +B input pin open.
- Note that analog system input/output pins other than P60 to P67, P96, PA0 to PA7, PB0 to PB4, DVP, DVM, HVP, HVM, VBUS, $\overline{\text{HCON}}$
- Sample recommended circuits:

- Input/output equivalent circuits

Protective diode

Limiting resistance

+B input (0 V   to 16 V)

V_{CC}

Pch

Nch

R
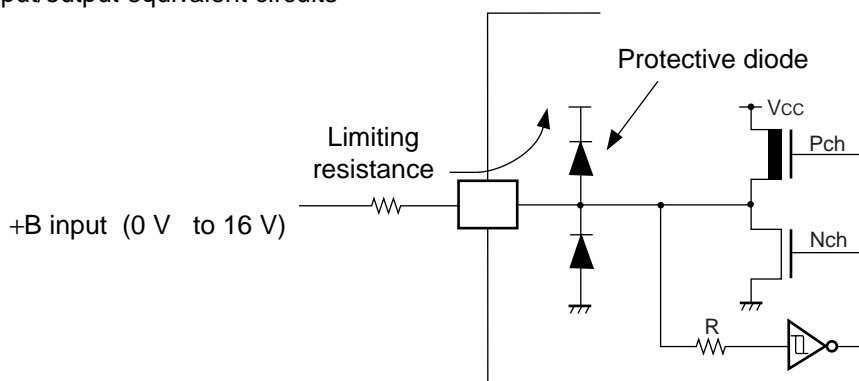

*7 : A peak value of an applicable one pin is specified as a maximum output current.

*8 : The average output current specifies the mean value of the current flowing in the relevant single pin during a period of 100 ms.

*9 : The average total output current specifies the mean value of the currents flowing in all of the relevant pins during a period of 100 ms.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

2. Recommended Operating Conditions

$(V_{SS} = AV_{SS} = 0.0 \text{ V})$

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	V_{CC}	3.0	3.6	V	At normal operation (when using USB)
		2.7	3.6	V	At normal operation (when not using USB)
		1.8	3.6	V	Hold state of stop operation
Input "H" voltage	V_{IH}	$0.7 V_{CC}$	$V_{CC} + 0.3$	V	CMOS input pin
	V_{IHS1}	$0.8 V_{CC}$	$V_{CC} + 0.3$	V	CMOS hysteresis input pin
	V_{IHS2}	$0.8 V_{CC}$	$V_{SS} + 5.3$	V	Nch open-drain (Withstand voltage of 5 V I/O)*
	V_{IHM}	$V_{CC} - 0.3$	$V_{CC} + 0.3$	V	MD pin input
	V_{IHUSB}	2.0	$V_{CC} + 0.3$	V	USB pin input
Input "L" voltage	V_{IL}	$V_{SS} - 0.3$	$0.3 V_{CC}$	V	CMOS input pin
	V_{ILS}	$V_{SS} - 0.3$	$0.2 V_{CC}$	V	CMOS hysteresis input pin
	V_{ILM}	$V_{SS} - 0.3$	$V_{SS} + 0.3$	V	MD pin input
	V_{ILUSB}	V_{SS}	0.8	V	USB pin input
Differential input sensitivity	V_{DI}	0.2	—	V	USB pin input
Differential common mode input voltage range	V_{CM}	0.8	2.5	V	USB pin input
Series resistance	R_S	25	30	Ω	Recommended value = 27 Ω at using USB
Operating temperature	T_A	-40	$+85$	$°C$	When not using USB
		0	$+70$	$°C$	When using USB

* : Applicable to pins : P60 to P67, P96, PA0 to PA7, PB0 to PB4, VBUS

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

(2)Clock output timing

$(V_{SS} = AV_{SS} = 0.0 \text{ V}, T_A = -40\ ^\circ\text{C to} +85\ ^\circ\text{C})$

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Cycle time	t_{CYC}	CLK	—	t_{CP}	—	ns	
CLK↑→CLK↓	t_{CHCL}	CLK	$V_{CC} = 3.0 \text{ V to } 3.6 \text{ V}$	$t_{CP}/2 - 15$	$t_{CP}/2 + 15$	ns	At $f_{cp} = 24$ MHz
				$t_{CP}/2 - 20$	$t_{CP}/2 + 20$	ns	At $f_{cp} = 12$ MHz
				$t_{CP}/2 - 64$	$t_{CP}/2 + 64$	ns	At $f_{cp} = 6$ MHz

Note : t_{CP} : See " (1) Clock input timing".

(3) Reset

$(V_{CC} = AV_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}, V_{SS} = AV_{SS} = 0.0 \text{ V}, T_A = -40\,°C \text{ to} +85\,°C)$

Parameter	Sym-bol	Pin name	Condi-tions	Value Min	Value Max	Unit	Remarks
Reset input time	t_{RSTL}	$\overline{RST}$	—	500	—	ns	At normal operating, At time base timer mode, At main sleep mode, At PLL sleep mode
				Oscillation time of oscillator* + 500 ns	—	µs	At stop mode, At sub clock mode, At sub sleep mode, At watch mode

* : Oscillation time of oscillator is the time that the amplitude reaches 90 %. It takes several milliseconds to several dozens of milliseconds on a crystal oscillator, several hundreds of microseconds to several milliseconds on a FAR/ceramic oscillator, and 0 milliseconds on an external clock.

- During normal operation, time-base timer mode, main sleep mode and PLL sleep mode
- During stop mode, subclock mode, sub-sleep mode and watch mode

97

(4) Power-on reset

$(V_{CC} = AV_{CC} = 3.3\ V \pm 0.3\ V, V_{SS} = AV_{SS} = 0.0\ V, T_A = -40\ °C\ to +85\ °C)$

Parameter	Symbol	Pin name	Condi-tions	Value Min	Max	Unit	Remarks
Power supply rising time	t_R	V_{CC}	—	—	30	ms	
Power supply shutdown time	t_{OFF}	V_{CC}		1	—	ms	For repeated operation

Notes : • V_{CC} must be lower than 0.2 V before the power supply is turned on.
        • The above standard is a value for performing a power-on reset.
        • In the device, there are internal registers which is initialized only by a power-on reset.
          When the initialization of these items is expected, turn on the power supply according to the standards.
Sudden change of power supply voltage may activate the power-on reset function.
When changing the power supply voltage during operation as illustrated below, voltage fluctuation should be minimized so that the voltage rises as smoothly as possible. When raising the power, do not use PLL clock. However, if voltage drop is 1 V/s or less, use of PLL clock is allowed during operation.

98

(5) UART0, 1, 2, 3 I/O extended serial timing

$(V_{CC} = AV_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}, V_{SS} = AV_{SS} = 0.0 \text{ V}, T_A = -40 \degree C \text{ to } +85 \degree C)$

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Serial clock cycle time	t_{SCYC}	SCKx	Internal shift clock mode output pin is : $C_L = 80 \text{ pF} + 1\text{TTL}$	$8\ t_{CP}$	—	ns	
SCK↓→SOT delay time	t_{SLOV}	SCKx, SOTx		– 80	+ 80	ns	
Valid SIN→SCK↑	t_{IVSH}	SCKx, SINx		100	—	ns	
SCK↑→valid SIN hold time	t_{SHIX}	SCKx, SINx		60	—	ns	
Serial clock H pulse width	t_{SHSL}	SCKx, SINx	External shift clock mode output pin is : $C_L = 80 \text{ pF} + 1\text{TTL}$	$4\ t_{CP}$	—	ns	
Serial clock L pulse width	t_{SLSH}	SCKx, SINx		$4\ t_{CP}$	—	ns	
SCK↓→SOT delay time	t_{SLOV}	SCKx, SOTx		—	150	ns	
Valid SIN→SCK↑	t_{IVSH}	SCKx, SINx		60	—	ns	
SCK↑→valid SIN hold time	t_{SHIX}	SCKx, SINx		60	—	ns	

Notes : • Above rating is the case of CLK synchronous mode.
• C_L is a load capacitance value on pins for testing.
• t_{CP} : See " (1) Clock input timing".

• Internal shift clock mode

• External shift clock mode

Interchannel disparity	—	AN0 to AN15	—	—	4	LSB	

*1 : t_{CP} : See " (1) Clock input timing".

*2 : The current when the CPU is in stop mode and the A/D converter is not operating (For $V_{CC} = AV_{CC} = AVRH = 3.3 \text{ V}$).

Notes :

● **About the external impedance of the analog input and its sampling time**
  ● A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion presicion.

● Analog input circuit model

Analog input — During sampling : ON — R — C — Comparator
	R	C
MB90333A	1.9 kΩ (Max)	32.3 pF (Max)
MB90F334A	1.9 kΩ (Max)	25.0 pF (Max)
MB90V330A	1.9 kΩ (Max)	32.3 pF (Max)

Note : The values are reference values.

  ● To satisfy the A/D conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the resistor value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value.

● The relationship between the external impedance and minimum sampling time

(External impedance = 0 kΩ to 100 kΩ)   (External impedance = 0 kΩ to 20 kΩ)

MB90333A/MB90V330A   MB90F334A

MB90F333A/MB90V330A   MB90F334A
  ● If the sampling time cannot be sufficient, connect a capacitor of about 0.1 μF to the analog input pin.

● **About errors**
  As |AVRH| becomes smaller, values of relative errors grow larger.

109

6. USB characteristics

$(V_{CC} = AV_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}, V_{SS} = AV_{SS} = 0.0 \text{ V}, T_A = 0 \text{ °C to } + 70 \text{ °C})$

Parameter		Symbol	Value		Unit	Remarks
			Min	Max		
Input characteristics	Input High level voltage	V_{IH}	2.0	—	V	
	Input Low level voltage	V_{IL}	—	0.8	V	
	Differential input sensitivity	V_{DI}	0.2	—	V	
	Differential common mode range	V_{CM}	0.8	2.5	V	
Output characteristics	Output High level voltage	V_{OH}	2.8	3.6	V	$I_{OH} = -200 \text{ μA}$
	Output Low level voltage	V_{OL}	0.0	0.3	V	$I_{OL} = 2 \text{ mA}$
	Cross over voltage	V_{CRS}	1.3	2.0	V	
	Rise time	t_{FR}	4	20	ns	Full Speed
		t_{LR}	75	300	ns	Low Speed
	Fall time	t_{FF}	4	20	ns	Full Speed
		t_{LF}	75	300	ns	Low Speed
	Rising/falling time matching	t_{RFM}	90	111.11	%	(T_{FR}/T_{FF})
		t_{RLM}	80	125	%	(T_{LR}/T_{LF})
	Output resistance	Z_{DRV}	28	44	Ω	Including Rs = 27 Ω

• Data signal timing (Full Speed)
• Data signal timing (Low Speed)

- Load condition (Full Speed)

DVP/HVP $R_S = 27\ \Omega$ Testing point

$C_L = 50\ pF$

DVM/HVM $R_S = 27\ \Omega$ Testing point

$C_L = 50\ pF$
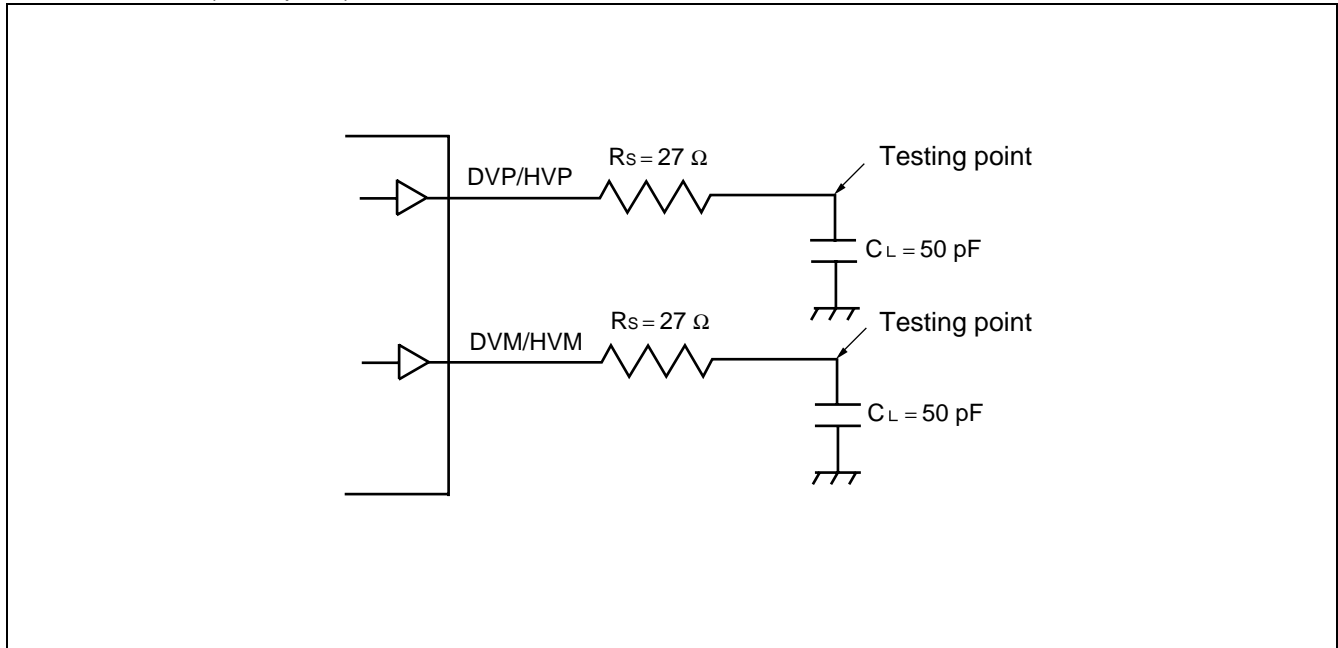

- Load condition (Low Speed)

HVP $R_S = 27\ \Omega$ Testing point

$C_L = 50\ pF\ to\ 150\ pF$

HVM $R_S = 27\ \Omega$ Testing point

$C_L = 50\ pF\ to\ 150\ pF$

7. Flash memory write/erase characteristics

Parameter	Condition	Value			Unit	Remarks
		Min	Typ	Max		
Sector erase time	$T_A = +25\ °C$ $V_{CC} = 3.0\ V$	—	1	15	s	Excludes 00_H programming prior to erasure.
Chip erase time		—	9	—	s	Excludes 00_H programming prior to erasure.
Word (16-bit width) programming time		—	16	3,600	μs	Except for over head time of system level
Programming/erase cycle	—	10,000	—	—	cycle	
Flash memory data retaining period	Average $T_A = +85\ °C$	20	—	—	year	*

* : This value comes from the technology qualification. (using Arrhenius equation to translate high temperature measurements into normalized value at + 85 °C)

■ **ORDERING INFORMATION**

Part number	Package	Remarks
MB90F334APFF MB90333APFF	120-pin Plastic LQFP (FPT-120P-M05)	
MB90F334APMC MB90333APMC	120-pin Plastic LQFP (FPT-120P-M21)	
MB90V330A	299-pin Ceramic PGA (PGA-299C-A01)	For evaluation

■ PACKAGE DIMENSIONS

120-pin Plastic LQFP
(FPT-120P-M05)

Note 1) * : These dimensions do not include resin protrusion.
Note 2) Pins width and pins thickness include plating thickness.
Note 3) Pins width do not include tie bar cutting remainder.
