Multi page intelligent teletext decoder

SAA5360; SAA5361

1 FEATURES

- Support for 50 or 60 and 100 or 120 Hz and progressive scan display modes
- Complete 625 line teletext decoder in one chip reduces printed-circuit board area and cost
- Automatic detection of transmitted fasttext links or service information (packet 8/30)
- On-Screen Display (OSD) for user interface menus using teletext and dedicated menu icons
- Video Programming System (VPS) decoding
- Wide Screen Signalling (WSS) decoding
- SAA5360 supports Pan-European, Arabic and Iranian character sets
- SAA5361 supports Pan-European, Cyrillic, Greek and Arabic character sets
- High-level command interface via I²C-bus gives easy control with a low software overhead
- High-level command interface is backward compatible to Stand-Alone Fasttext And Remote Interface (SAFARI)
- 625 and 525 line display
- RGB interface to standard colour decoder ICs; current source
- Versatile 8-bit open-drain Input/Output (I/O) expander; 5 V tolerant
- Single 12 MHz crystal oscillator
- Single power supply: from 3.0 V to 3.6 V
- Operating temperature: -20 to +70 °C

- Automatic detection of transmitted pages to be selected by page up and page down
- 8 page fasttext decoder
- Table Of Pages (TOP) decoder with Basic Top Table (BTT) and Additional Information Tables (AITs)
- 4 page user-defined list mode.

2 GENERAL DESCRIPTION

The SAA5360; SAA5361 is a single-chip multi page 625 line world system teletext decoder with a high-level command interface, and is SAFARI compatible.

The device is designed to minimize the overall system cost, due to the high-level command interface offering the benefit of a low software overhead in the TV microcontroller.

The SAA5360 incorporates the following functions:

- 10 page teletext decoder with OSD, fasttext, TOP, default and list acquisition modes
- Automatic channel installation support.

The functionality of the SAA5361 is similar to the SAA5360, but offers the capability to store up to 250 additional pages of teletext in an external SRAM.

3 QUICK REFERENCE DATA

| SYMBOL | PARAMETER | CONDITIONS | MIN. | TYP. | MAX. | UNIT |
|------------------------|---------------------------|-------------------------------|------|------|------|------|
| V _{DD} | all supply voltages | referenced to V _{SS} | 3.0 | 3.3 | 3.6 | V |
| I _{DDP} | periphery supply current | note 1 | 1 | – | – | mA |
| I _{DDC} | core supply current | normal mode | – | 15 | 18 | mA |
| | | idle mode | – | 4.6 | 6 | mA |
| I _{DDA} | analog supply current | normal mode | – | 45 | 48 | mA |
| | | idle mode | – | 0.87 | 1 | mA |
| f _{xtal(nom)} | nominal crystal frequency | fundamental mode | – | 12 | – | MHz |
| T _{amb} | ambient temperature | | -20 | – | +70 | °C |
| T _{stg} | storage temperature | | -55 | – | +125 | °C |

Note

1. Periphery supply current is dependent on external components and I/O voltage levels.

7 COMMANDS AND CHARACTER SETS**7.1 High-level command interface**

The I²C-bus interface is used to pass control commands and data between the SAA5360; SAA5361 and the television microcontroller. The interface uses high-level commands, which are backwards compatible with the SAFARI.

The I²C-bus transmission formats are given in Tables 1 to 3.

Table 1 User command

| USER COMMAND | | | | | | |
|--------------|------------------------------|-------|-----|---------|-----|------|
| START | I ² C-bus address | write | ACK | command | ACK | STOP |

Table 2 System command

| SYSTEM COMMAND | | | | | | | | |
|----------------|------------------------------|-------|-----|---------|-----|-----------|-----|------|
| START | I ² C-bus address | write | ACK | command | ACK | parameter | ACK | STOP |

Table 3 User read

| USER READ | | | | | | |
|-----------|------------------------------|------|-----|------|-----|------|
| START | I ² C-bus address | read | ACK | data | ACK | STOP |

7.2 Character sets

The SAA5360HL/M1/0004 contains the character set for Pan-Euro, Arabic and Iranian and has slave address 58H.

The SAA5361HL/M1/1651 contains the character set for Pan-Euro, Cyrillic, Greek and Arabic and has slave address 60H.

Multi page intelligent teletext decoder

SAA5360; SAA5361

8 LIMITING VALUES

In accordance with Absolute Maximum Rating System (IEC 60134).

| SYMBOL | PARAMETER | CONDITIONS | MIN. | MAX. | UNIT |
|-------------|----------------------------------|---|------|----------------|------|
| V_{DD} | all supply voltages | | -0.5 | +4.0 | V |
| V_I | input voltage (any input) | $V_{DD} < 3.6$ V; note 1 | -0.5 | $V_{DD} + 0.5$ | V |
| | | $V_{DD} \geq 3.6$ V; note 1 | -0.5 | 4.1 | V |
| V_O | output voltage (any output) | note 1 | -0.5 | $V_{DD} + 0.5$ | V |
| I_O | output current (each output) | | - | 10 | mA |
| $I_{IO(d)}$ | diode DC input or output current | | - | 20 | mA |
| T_{amb} | ambient temperature | | -20 | +70 | °C |
| T_j | junction temperature | | -20 | +125 | °C |
| T_{stg} | storage temperature | | -55 | +125 | °C |
| V_{esd} | electrostatic discharge voltage | Human body model; $C = 100$ pF; $R = 1.5$ k Ω | - | 2000 | V |
| | | Machine model; $C = 200$ pF; $R = 0$ Ω | - | 200 | V |
| I_{lu} | latch-up current | $1.5 \times V_{DD}$ | - | 100 | mA |

Note

1. This maximum value refers to 5 V tolerant I/Os and may be 6 V maximum but only when V_{DD} is present.

9 THERMAL CHARACTERISTICS

| SYMBOL | PARAMETER | CONDITIONS | VALUE | UNIT |
|---------------|---|-------------|-------|------|
| $R_{th(j-a)}$ | thermal resistance from junction to ambient | in free air | 52 | K/W |
| $R_{th(j-c)}$ | thermal resistance from junction to case | | 8 | K/W |

10 QUALITY AND RELIABILITY

In accordance with "General Quality Specification for Integrated circuits SNW-FQ-611".

Multi page intelligent teletext decoder

SAA5360; SAA5361

11 CHARACTERISTICS

$V_{DD} = 3.3 \text{ V} \pm 10 \%$; $V_{SS} = 0 \text{ V}$; $T_{amb} = -20 \text{ }^{\circ}\text{C}$ to $+70 \text{ }^{\circ}\text{C}$; unless otherwise specified.

| SYMBOL | PARAMETER | CONDITIONS | MIN. | TYP. | MAX. | UNIT |
|----------------------|---|---|-------|-------|-------|------|
| Supplies | | | | | | |
| V _{DD} | any supply voltage | referenced to V _{SS} | 3.0 | 3.3 | 3.6 | V |

SAA5360; SAA5361

Notes

1. Periphery current is dependent on external components and voltage levels on I/Os.
2. V_{TN} is the drop across a protection transistor which clamps the input to V_{DD} . The maximum value is $V_{TN} = 0.75\text{ V}$.
3. Crystal order number 4322 143 05561.
4. If the 4322 143 05561 crystal is not used, the formula in the crystal specification should be used. The mean of the capacitances due to the chip at XTALIN and at XTALOUT is C_{IO} , where $C_{IO} = 7\text{ pF}$. C_{ext} is a value for the mean of the stray capacitances due to the external circuits at XTALIN and XTALOUT.
 - a) $C_{osc(typ)} = 2C_L - C_{IO} - C_{ext}$. Capacitor C_{osc} may need to be reduced from the initial selected value.
 - b) $C_{O(max)} = 35 - 0.5 (C_{osc} + C_{IO} + C_{ext})\text{ pF}$. The maximum value for the crystal holder capacitance is to ensure start-up.
5. A device must internally provide a hold time of at least 300 ns for the SDA signal, referenced to the $V_{IH(min)}$ of the SCL signal, in order to bridge the undefined region of the falling edge of SCL.
6. The maximum $t_{HD,DAT}$ has only to be met if the device does not stretch the LOW period of the SCL signal ($t_{LOW(SCL)}$).
7. A fast mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement $t_{SU,DAT} \geq 250\text{ ns}$ must be met. This requirement is met for a device that does not stretch $t_{LOW(SCL)}$. If a device does stretch $t_{LOW(SCL)}$, the next data bit to the SDA line must be output $t_{r(max)} + t_{SU,DAT} = 1000 + 250 = 1250\text{ ns}$ before the SCL line is released (according to the standard-mode I²C-bus specification).
8. C_b = total capacitance of one bus line in pF.

12 APPLICATION INFORMATION**12.1 EMC guidelines**

Optimization of circuit return paths and minimization of common mode emission is achieved by a double sided Printed-Circuit Board (PCB) with low inductance ground plane.

On a single-sided PCB a local ground plane under the whole IC should be present. Preferably, the PCB local ground plane connection should not be connected to other grounds on route to the PCB ground. Do not use wire links. Wire links cause ground inductance which increases ground bounce.

The supply pins can be decoupled at the ground pin plane below the IC. This is easily achieved by using surface mount capacitors, which, at high frequency, are more effective than components with leads.

Using a device socket would increase the area and therefore increase the inductance of the external bypass loop.

To provide a high-impedance to any high frequency signals on the V_{DD} supplies to the IC, a ferrite bead or inductor can be connected in series with the supply line close to the decoupling capacitor. To prevent signal radiation, pull-up resistors of signal outputs should not be connected to the V_{DD} supply on the IC side of the ferrite bead or inductor.

OSCGND should only be connected to the crystal load capacitors and not to any other ground connection.

Distances to physical connections of associated active devices should be as short as possible.

PCB output tracks should have close proximity, mutually coupled and ground return paths.

SAA5360; SAA5361

12.3 Application notes

Ports AD0 to AD7 of the microcontroller can be connected to pins D0 to D7 of the SRAM in any order.

For the addressing, the lower group of address lines (A0 to A8) and the upper group of address lines (A9 to A14, A15_BK, RAMBK0 and RAMBK1) may be connected in any order within the groups, provided that the full 256 kbytes of external SRAM is used.

Fig.5 shows the application diagram of the SAA5361 with external SRAM connections.

When using an external SRAM smaller than 256 kbytes, the relevant number of bits from the microcontroller address bus should be disconnected, always removing the most significant bits first.

For power saving modes, it might be advisable to control the CE pin of the SRAM module(s) using one of the microcontroller ports to de-select the SRAM.

12.3.1 EXTERNAL DATA MEMORY ACCESS

Table 4 External data memory access (see Fig.6 and Fig.7)

| SYMBOL | PARAMETER | TYPICAL ⁽¹⁾ | UNIT |
|------------|---|------------------------|------|
| t_{RLRH} | \overline{RD} pulse width | 250 | ns |
| t_{WLWH} | \overline{WR} pulse width | 250 | ns |
| t_{RLDV} | \overline{RD} LOW to valid data in | 198 | ns |
| t_{RHDX} | Data hold after \overline{RD} | 0 | ns |
| t_{RHDZ} | Data float after \overline{RD} | tbd | ns |
| t_{LLWL} | ALE LOW to \overline{RD} or \overline{WR} LOW | 132 | ns |
| t_{AVWL} | Address valid to \overline{WR} LOW or \overline{RD} LOW | 172 | ns |
| t_{QVWX} | Data valid to \overline{WR} LOW | 89 | ns |
| t_{WHQX} | Data hold after \overline{WR} | 15 | ns |
| t_{RLAZ} | \overline{RD} LOW to address float | tbd | ns |
| t_{WHLH} | \overline{RD} or \overline{WR} HIGH to ALE HIGH | 40 | ns |

Note

1. The timings are only valid for the nominal 12 MHz clock provided to the microcontroller.

12.3.2 SYMBOL EXPLANATIONS

Each timing symbol has five characters. The first character is always 't' (time). Depending on their positions, the other characters indicate the name of a signal or the logical status of that signal.

The designations are:

A = Address

C = Clock

D = Input data

H = Logic level HIGH

I = Instruction (program memory contents)

L = Logic level LOW, or ALE

P = PSEN

Q = Output data

R = RD signal

t = Time

V = Valid

W = WR signal

X = No longer a valid logic level

Z = Float

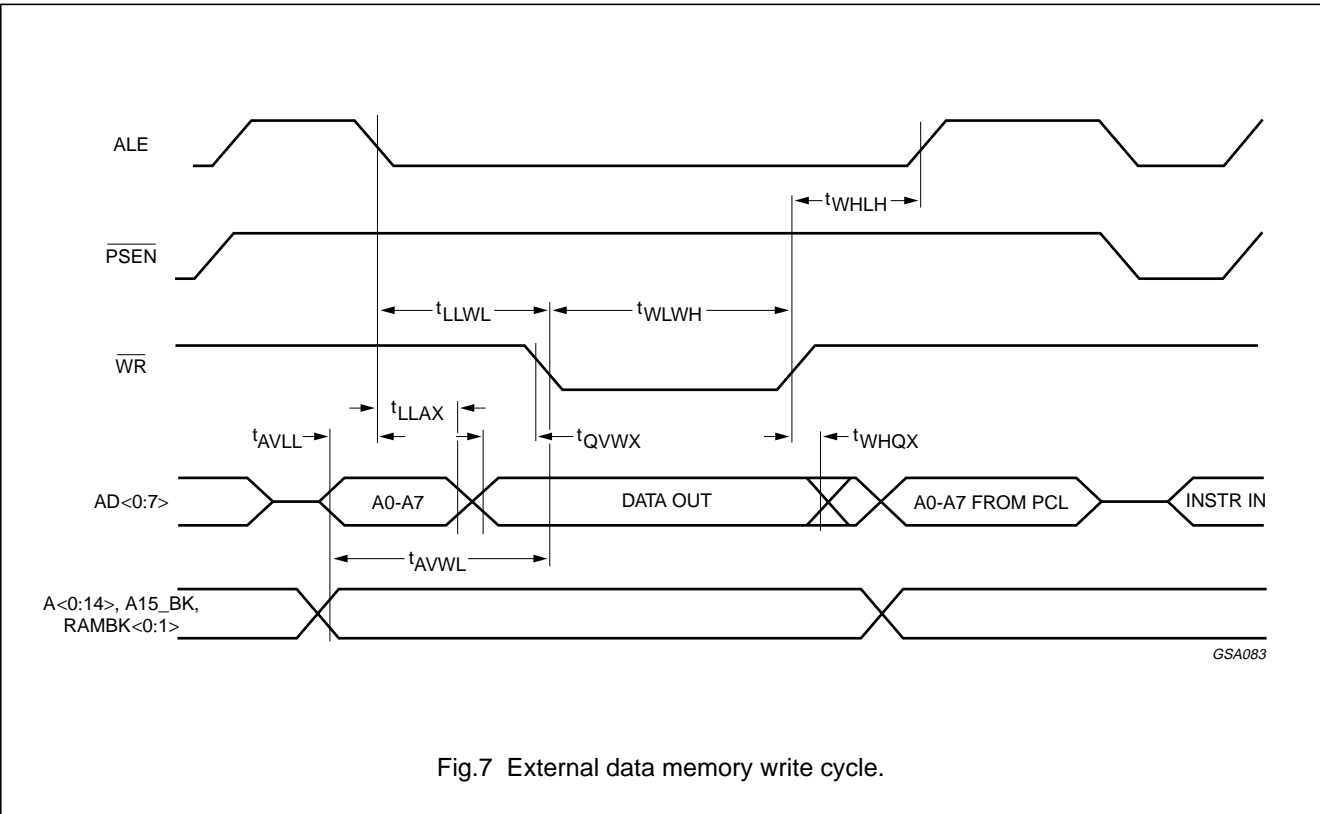

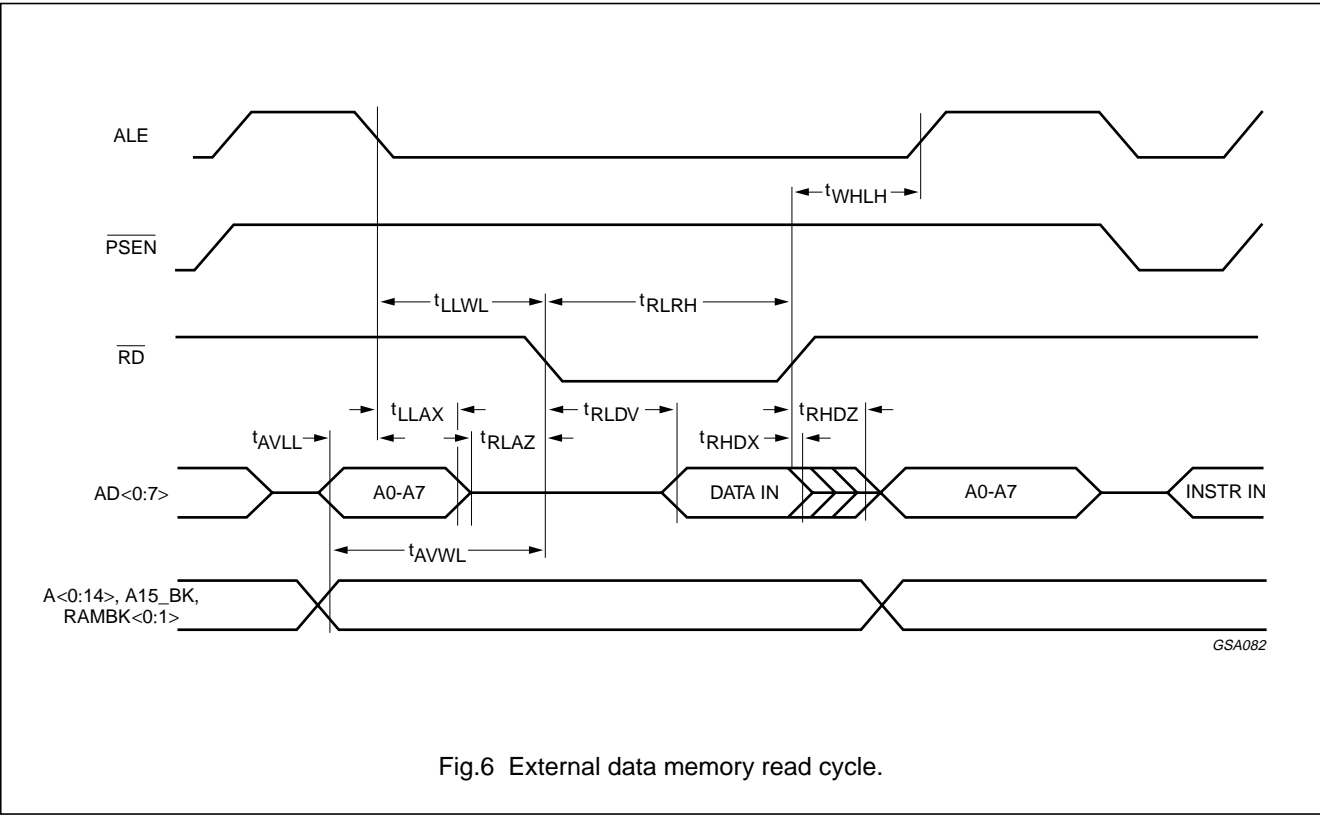

Examples:

t_{AVLL} = time for address valid to ALE LOW.

t_{LLPL} = time for ALE to PSEN LOW.

14 SOLDERING**14.1 Introduction to soldering surface mount packages**

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

14.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON..T and SSOP..T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

14.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

14.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 °C and 320 °C.

| LQFP, QFP, TQFP | not recommended ⁽⁵⁾⁽⁶⁾ | suitable |
| SSOP, TSSOP, VSO, VSSOP | not recommended ⁽⁷⁾ | suitable |
| CWQCCN..L ⁽⁸⁾ , PMFP ⁽⁹⁾ , WQCCN..L ⁽⁸⁾ | not suitable | not suitable |

Notes

- For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
- These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217\text{ °C} \pm 10\text{ °C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- Hot bar soldering or manual soldering is suitable for PMFP packages.

15 DATA SHEET STATUS

| LEVEL | DATA SHEET STATUS ⁽¹⁾ | PRODUCT STATUS ⁽²⁾⁽³⁾ | DEFINITION |
|-------|----------------------------------|----------------------------------|--|
| I | Objective data | Development | This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice. |
| II | Preliminary data | Qualification | This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product. |
| III | Product data | Production | This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). |

Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
3. For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

16 DEFINITIONS

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

17 DISCLAIMERS

Life support applications — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
