

General Description

The MAX4444/MAX4445 differential line receivers offer unparalleled high-speed, low-distortion performance. Using a three op amp instrumentation amplifier architecture, these ICs have symmetrical differential inputs and a single-ended output. They operate from $\pm 5 V$ supplies and are capable of driving a 100Ω load to $\pm 3.7 V$. The MAX4444 has an internally set closed-loop gain of $\pm 2 V/V$, while the MAX4445 is compensated for gains of $\pm 2 V/V$ or greater, set by an external resistor. A low-power enable mode reduces current consumption to 3.5 mA.

Using current-feedback techniques, the MAX4444/ MAX4445 achieve a 550MHz bandwidth while maintaining up to a 5000V/µs slew rate. Excellent differential gain/phase and noise specifications make these amplifiers ideal for a wide variety of video and RF signal-processing applications. An evaluation kit is available to speed design.

Features

- ♦ 5000V/µs Slew Rate (MAX4444)
- + +2V/V Internally Fixed Gain (MAX4444)
- **♦** External Gain Selection (MAX4445, A_{VCL} ≥ +2V/V)
- ♦ 550MHz -3dB Bandwidth
- ♦ -60dB SFDR at 5MHz
- ♦ Low Differential Gain/Phase: 0.07%/0.05°
- ♦ Low Noise: $25 \text{nV} / \sqrt{\text{Hz}}$ at f_{IN} = 100 kHz
- Low-Power Disable Mode Reduces Quiescent Current to 3.5mA

Applications

Differential-to-Single-Ended Conversion

Twisted-Pair to Coaxial Converter

High-Speed Instrumentation Amplifier

Data Acquisition

Medical Instrumentation

High-Speed Differential Line Receiver

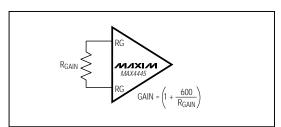

Figure 1. Setting the Amplifier Gain

Detailed Description

The MAX4444/MAX4445 differential-to-single-ended line receivers offer high-speed and low-distortion performance, and are ideally suited for video and RF signal-processing applications. These receivers offer a small-signal bandwidth of 550MHz and have a high slew rate of up to 5000V/µs. Their 120mA output capability allows them to be directly coupled to data acquisition systems.

Applications Information. Grounding Bypassing

Use the following high-frequency design techniques when designing the PC board for the MAX4444/ MAX4445.

- Use a multilayer board with one layer dedicated as the ground plane.
- Do not use wire wrap or breadboards due to high inductance.
- Avoid IC sockets due to high parasitic capacitance and inductance.
- Bypass supplies with a 0.1µF capacitor. Use surface-mount capacitors to minimize lead inductance.
- Keep signal lines as short and straight as possible.
 Do not make 90° turns. Use rounded corners. Do not cross signal paths if possible.
- · Ensure that the ground plane is free from voids.

Low-Power Enable Mode

The MAX4444/MAX4445 are disabled when EN goes low. This reduces supply current to only 3.5mA. As the output becomes higher impedance, the effective impedance at the output for the MAX4444 is $1.8k\Omega$. The effective output impedance for the MAX4445 is $1.8k\Omega$ plus RGAIN.

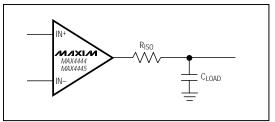

Figure 2. Using an Isolation Resistor for High Capacitive Loads

Setting Gain (MAX4445)

The MAX4445 is stable with a minimum gain configuration of +2V/V. RGAIN, connected between the RG pins, sets the gain of this device as shown in Figure 1. Calculate the expected gain as follows:

Gain = (1 + 600 / RGAIN)

Driving Capacitive Loads

The MAX4444/MAX4445 are designed to drive capacitive loads. However, excessive capacitive loads may cause ringing or instability at the output as the phase margin of the device reduces. Adding a small series isolation resistor at the output helps reduce the ringing but slightly increases gain error (Figure 2). For recommended values, see *Typical Operating Characteristics*.

Coaxial Line Driver

The MAX4444/MAX4445 are well suited to drive coaxial cables. Their high output current capability can easily drive the 75Ω characteristic impedance of common coaxial cables. Adjust the gain of the MAX4445 to compensate for cable losses to maintain the required levels at the input of the next stage.
