#### **Features**

- High Performance, Low Power AVR® 8-Bit Microcontroller
- Advanced RISC Architecture
  - 135 Powerful Instructions Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers
  - Fully Static Operation
  - Up to 16 MIPS Throughput at 16 MHz
  - On-Chip 2-cycle Multiplier
- High Endurance Non-volatile Memory Segments
  - 64K/128K/256K Bytes of In-System Self-Programmable Flash
  - 4K Bytes EEPROM
  - 8K Bytes Internal SRAM
  - Write/Erase Cycles:10,000 Flash/100,000 EEPROM
  - Data retention: 20 years at 85°C/ 100 years at 25°C
  - Optional Boot Code Section with Independent Lock Bits
    - In-System Programming by On-chip Boot Program
    - True Read-While-Write Operation
  - Programming Lock for Software Security
    - Endurance: Up to 64K Bytes Optional External Memory Space
- JTAG (IEEE std. 1149.1 compliant) Interface
  - Boundary-scan Capabilities According to the JTAG Standard
  - Extensive On-chip Debug Support
  - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
- Peripheral Features
  - Two 8-bit Timer/Counters with Separate Prescaler and Compare Mode
  - Four 16-bit Timer/Counter with Separate Prescaler, Compare- and Capture Mode
  - Real Time Counter with Separate Oscillator
  - Four 8-bit PWM Channels
  - Six/Twelve PWM Channels with Programmable Resolution from 2 to 16 Bits (ATmega1281/2561, ATmega640/1280/2560)
  - Output Compare Modulator
  - 8/16-channel, 10-bit ADC (ATmega1281/2561, ATmega640/1280/2560)
  - Two/Four Programmable Serial USART (ATmega1281/2561,ATmega640/1280/2560)
  - Master/Slave SPI Serial Interface
  - Byte Oriented 2-wire Serial Interface
  - Programmable Watchdog Timer with Separate On-chip Oscillator
  - On-chip Analog Comparator
  - Interrupt and Wake-up on Pin Change
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated Oscillator
  - External and Internal Interrupt Sources
  - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby, and Extended Standby
- I/O and Packages
  - 54/86 Programmable I/O Lines (ATmega1281/2561, ATmega640/1280/2560)
  - 64-pad QFN/MLF, 64-lead TQFP (ATmega1281/2561)
  - 100-lead TQFP, 100-ball CBGA (ATmega640/1280/2560)
  - RoHS/Fully Green
- Temperature Range:
  - -40°C to 85°C Industrial
- Ultra-Low Power Consumption
  - Active Mode: 1 MHz, 1.8V: 500 μA
  - Power-down Mode: 0.1 µA at 1.8V
- Speed Grade:
  - ATmega640V/ATmega1280V/ATmega1281V:
    - 0 4 MHz @ 1.8 5.5V, 0 8 MHz @ 2.7 5.5V
  - ATmega2560V/ATmega2561V:
    - 0 2 MHz @ 1.8 5.5V, 0 8 MHz @ 2.7 5.5V
  - ATmega640/ATmega1280/ATmega1281:
    - 0 8 MHz @ 2.7 5.5V, 0 16 MHz @ 4.5 5.5V
  - ATmega2560/ATmega2561:
    - 0 16 MHz @ 4.5 5.5V

Figure 1-3. Pinout ATmega1281/2561

Note: The large center pad underneath the QFN/MLF package is made of metal and internally connected to GND. It should be soldered or glued to the board to ensure good mechanical stability. If the center pad is left unconnected, the package might loosen from the board.

## 1.1 Disclaimer

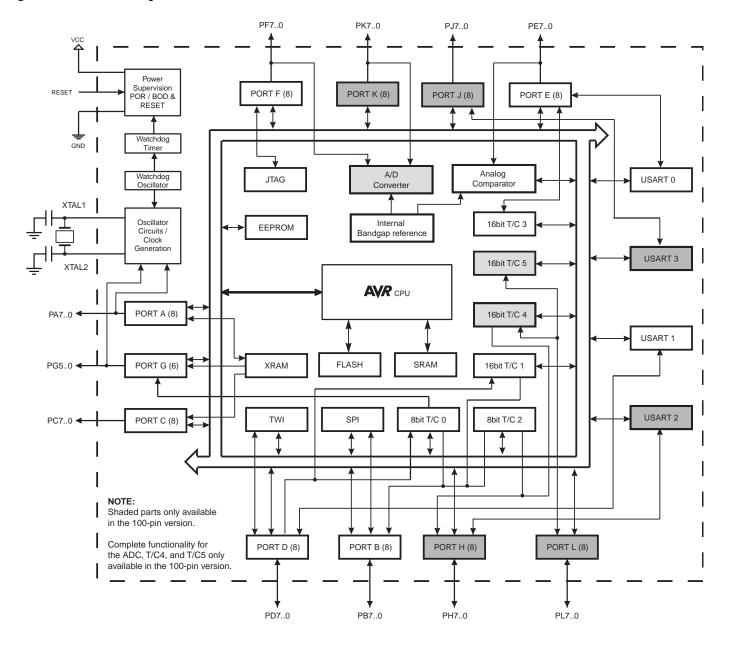

Typical values contained in this datasheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min. and Max values will be available after the device is characterized.

# 2. Overview

The ATmega640/1280/1281/2560/2561 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega640/1280/1281/2560/2561 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

# 2.1 Block Diagram

Figure 2-1. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega640/1280/1281/2560/2561 provides the following features: 64K/128K/256K bytes of In-System Programmable Flash with Read-While-Write capabilities, 4K bytes EEPROM, 8K bytes SRAM, 54/86 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), six flexible Timer/Counters with compare modes and PWM, 4 USARTs, a byte oriented 2-wire Serial Interface, a 16-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Powersave mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The Onchip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega640/1280/1281/2560/2561 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega640/1280/1281/2560/2561 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

# 2.2 Comparison Between ATmega1281/2561 and ATmega640/1280/2560

Each device in the ATmega640/1280/1281/2560/2561 family differs only in memory size and number of pins. Table 2-1 summarizes the different configurations for the six devices.

**Table 2-1.** Configuration Summary

Device	Flash	EEPROM	RAM	General Purpose I/O pins	16 bits resolution PWM channels	Serial USARTs	ADC Channels
ATmega640	64KB	4KB	8KB	86	12	4	16
ATmega1280	128KB	4KB	8KB	86	12	4	16
ATmega1281	128KB	4KB	8KB	54	6	2	8
ATmega2560	256KB	4KB	8KB	86	12	4	16
ATmega2561	256KB	4KB	8KB	54	6	2	8

# 2.3 Pin Descriptions

#### 2.3.1 VCC

Digital supply voltage.

#### 2.3.2 GND

Ground.

### 2.3.3 Port A (PA7..PA0)

Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 78.

#### 2.3.4 Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B has better driving capabilities than the other ports.

Port B also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 79.

### 2.3.5 Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up

resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the ATmega640/1280/1281/2560/2561 as listed on page 82.

#### 2.3.6 Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 83.

### 2.3.7 Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 86.

### 2.3.8 Port F (PF7..PF0)

Port F serves as analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a reset occurs.

Port F also serves the functions of the JTAG interface.

#### 2.3.9 Port G (PG5..PG0)

Port G is a 6-bit I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features of the ATmega640/1280/1281/2560/2561 as listed on page 90.

#### 2.3.10 Port H (PH7..PH0)

Port H is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port H output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port H pins that are externally pulled low will source current if the pull-up

# 8 ATmega640/1280/1281/2560/2561

# ATmega640/1280/1281/2560/2561

resistors are activated. The Port H pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port H also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 92.

#### 2.3.11 Port J (PJ7..PJ0)

Port J is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port J output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port J pins that are externally pulled low will source current if the pull-up resistors are activated. The Port J pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port J also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 95.

#### 2.3.12 Port K (PK7..PK0)

Port K serves as analog inputs to the A/D Converter.

Port K is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port K output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port K pins that are externally pulled low will source current if the pull-up resistors are activated. The Port K pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port K also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 96.

### 2.3.13 Port L (PL7..PL0)

Port L is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port L output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port L pins that are externally pulled low will source current if the pull-up resistors are activated. The Port L pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port L also serves the functions of various special features of the ATmega640/1280/2560 as listed on page 98.

#### 2.3.14 **RESET**

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in "System and Reset Characteristics" on page 375. Shorter pulses are not guaranteed to generate a reset.

# 2.3.15 XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

#### 2.3.16 XTAL2

Output from the inverting Oscillator amplifier.

#### 2.3.17 AVCC

AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to  $V_{CC}$ , even if the ADC is not used. If the ADC is used, it should be connected to  $V_{CC}$  through a low-pass filter.

#### 2.3.18 AREF

This is the analog reference pin for the A/D Converter.

# 3. Resources

A comprehensive set of development tools and application notes, and datasheets are available for download on http://www.atmel.com/avr.

# 4. Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

Notes: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

- 2. I/O registers within the address range \$00 \$1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
- 4. When using the I/O specific commands IN and OUT, the I/O addresses \$00 \$3F must be used. When addressing I/O registers as data space using LD and ST instructions, \$20 must be added to these addresses. The ATmega640/1280/1281/2560/2561 is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from \$60 \$1FF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

# 6. Instruction Set Summary

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ARITHMETIC AND I	OGIC INSTRUCTIONS	S	-	_	
ADD	Rd, Rr	Add two Registers	$Rd \leftarrow Rd + Rr$	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	Rdh:Rdl ← Rdh:Rdl + K	Z,C,N,V,S	2
SUB	Rd, Rr	Subtract two Registers	Rd ← Rd - Rr	Z,C,N,V,H	1
SUBI	Rd, K	Subtract Constant from Register	$Rd \leftarrow Rd - K$	Z,C,N,V,H	1
SBC	Rd, Rr	Subtract with Carry two Registers	Rd ← Rd - Rr - C	Z,C,N,V,H	1
SBCI	Rd, K	Subtract with Carry Constant from Reg.	$Rd \leftarrow Rd - K - C$	Z,C,N,V,H	1
SBIW	Rdl,K	Subtract Immediate from Word	Rdh:Rdl ← Rdh:Rdl - K	Z,C,N,V,S	2
AND	Rd, Rr	Logical AND Registers	$Rd \leftarrow Rd \bullet Rr$	Z,N,V	1
ANDI	Rd, K	Logical AND Register and Constant	$Rd \leftarrow Rd \bullet K$	Z,N,V	1
OR	Rd, Rr	Logical OR Registers	$Rd \leftarrow Rd v Rr$	Z,N,V	1
ORI	Rd, K	Logical OR Register and Constant	$Rd \leftarrow Rd \vee K$	Z,N,V	1
EOR	Rd, Rr	Exclusive OR Registers	$Rd \leftarrow Rd \oplus Rr$	Z,N,V	1
COM	Rd	One's Complement	$Rd \leftarrow 0xFF - Rd$	Z,C,N,V	1
NEG	Rd	Two's Complement	$Rd \leftarrow 0x00 - Rd$	Z,C,N,V,H	1
SBR	Rd,K	Set Bit(s) in Register	$Rd \leftarrow Rd \vee K$	Z,N,V	1
CBR	Rd,K	Clear Bit(s) in Register	$Rd \leftarrow Rd \bullet (0xFF - K)$	Z,N,V	1
INC	Rd	Increment	Rd ← Rd + 1	Z,N,V	1
DEC	Rd	Decrement	Rd ← Rd − 1	Z,N,V	1
TST	Rd	Test for Zero or Minus	$Rd \leftarrow Rd \bullet Rd$	Z,N,V	1
CLR	Rd	Clear Register	$Rd \leftarrow Rd \oplus Rd$	Z,N,V	1
SER	Rd	Set Register	Rd ← 0xFF	None	1
MUL	Rd, Rr	Multiply Unsigned	R1:R0 ← Rd x Rr	Z,C	2
MULS	Rd, Rr	Multiply Signed	R1:R0 ← Rd x Rr	Z,C	2
MULSU	Rd, Rr	Multiply Signed with Unsigned	R1:R0 ← Rd x Rr	Z,C	2
FMUL	Rd, Rr	Fractional Multiply Unsigned	R1:R0 ← (Rd x Rr) << 1	Z,C	2
FMULS	Rd, Rr	Fractional Multiply Signed	R1:R0 ← (Rd x Rr) << 1	Z,C	2
FMULSU	Rd, Rr	Fractional Multiply Signed with Unsigned	$R1:R0 \leftarrow (Rd \times Rr) << 1$	Z,C	2
BRANCH INSTRUC	TIONS				
RJMP	k	Relative Jump	PC ← PC + k + 1	None	2
IJMP		Indirect Jump to (Z)	PC ← Z	None	2
EIJMP		Extended Indirect Jump to (Z)	PC ←(EIND:Z)	None	2
JMP	k	Direct Jump	PC ← k	None	3
RCALL	k	Relative Subroutine Call	PC ← PC + k + 1	None	4

DRAWING NO.	REV.
64A	В

# 8.4 64M2

### 9. Errata

# 9.1 ATmega640 rev. A

- Inaccurate ADC conversion in differential mode with 200x gain
- High current consumption in sleep mode

#### 1. Inaccurate ADC conversion in differential mode with 200x gain

With AVCC < 3.6V, random conversions will be inaccurate. Typical absolute accuracy may reach 64 LSB.

#### **Problem Fix/Workaround**

None

#### 2. High current consumption in sleep mode.

If a pending interrupt cannot wake the part up from the selected sleep mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

#### Problem Fix/Workaround

Before entering sleep, interrupts not used to wake the part from the sleep mode should be disabled.

# 9.2 ATmega1280 rev. A

- Inaccurate ADC conversion in differential mode with 200x gain
- · High current consumption in sleep mode

### 1. Inaccurate ADC conversion in differential mode with 200x gain

With AVCC < 3.6V, random conversions will be inaccurate. Typical absolute accuracy may reach 64 LSB.

#### **Problem Fix/Workaround**

None

### 2. High current consumption in sleep mode.

If a pending interrupt cannot wake the part up from the selected sleep mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

#### Problem Fix/Workaround

Before entering sleep, interrupts not used to wake the part from the sleep mode should be disabled.

### 9.3 ATmega1281 rev. A

- Inaccurate ADC conversion in differential mode with 200x gain
- High current consumption in sleep mode

#### 1. Inaccurate ADC conversion in differential mode with 200x gain

With AVCC < 3.6V, random conversions will be inaccurate. Typical absolute accuracy may reach 64 LSB.

#### **Problem Fix/Workaround**

None

# 20 ATmega640/1280/1281/2560/2561

#### 2. High current consumption in sleep mode.

If a pending interrupt cannot wake the part up from the selected sleep mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

#### Problem Fix/Workaround

Before entering sleep, interrupts not used to wake the part from the sleep mode should be disabled.

# 9.4 ATmega2560 rev. E

No known errata.

## 9.5 ATmega2560 rev. D

Not sampled.

# 9.6 ATmega2560 rev. C

· High current consumption in sleep mode

## 1. High current consumption in sleep mode.

If a pending interrupt cannot wake the part up from the selected sleep mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

#### Problem Fix/Workaround

Before entering sleep, interrupts not used to wake the part from the sleep mode should be disabled.

## 9.7 ATmega2560 rev. B

Not sampled.

## 9.8 ATmega2560 rev. A

- Non-Read-While-Write area of flash not functional
- Part does not work under 2.4 volts
- Incorrect ADC reading in differential mode
- Internal ADC reference has too low value
- . IN/OUT instructions may be executed twice when Stack is in external RAM
- EEPROM read from application code does not work in Lock Bit Mode 3

#### 1. Non-Read-While-Write area of flash not functional

The Non-Read-While-Write area of the flash is not working as expected. The problem is related to the speed of the part when reading the flash of this area.

#### Problem Fix/Workaround

- Only use the first 248K of the flash.
- If boot functionality is needed, run the code in the Non-Read-While-Write area at maximum 1/4th of the maximum frequency of the device at any given voltage. This is done by writing the CLKPR register before entering the boot section of the code

#### 2. Part does not work under 2.4 volts

The part does not execute code correctly below 2.4 volts

#### Problem Fix/Workaround

Do not use the part at voltages below 2.4 volts.

### 3. Incorrect ADC reading in differential mode

The ADC has high noise in differential mode. It can give up to 7 LSB error.

#### Problem Fix/Workaround

Use only the 7 MSB of the result when using the ADC in differential mode.

#### 4. Internal ADC reference has too low value

The internal ADC reference has a value lower than specified

#### Problem Fix/Workaround

- Use AVCC or external reference
- The actual value of the reference can be measured by applying a known voltage to the ADC when using the internal reference. The result when doing later conversions can then be calibrated.

#### 5. IN/OUT instructions may be executed twice when Stack is in external RAM

If either an IN or an OUT instruction is executed directly before an interrupt occurs and the stack pointer is located in external ram, the instruction will be executed twice. In some cases this will cause a problem, for example:

- If reading SREG it will appear that the I-flag is cleared.
- If writing to the PIN registers, the port will toggle twice.
- If reading registers with interrupt flags, the flags will appear to be cleared.

#### Problem Fix/Workaround

There are two application work-arounds, where selecting one of them, will be omitting the issue:

- Replace IN and OUT with LD/LDS/LDD and ST/STS/STD instructions
- Use internal RAM for stack pointer.

### 6. EEPROM read from application code does not work in Lock Bit Mode 3

When the Memory Lock Bits LB2 and LB1 are programmed to mode 3, EEPROM read does not work from the application code.

#### Problem Fix/Workaround

Do not set Lock Bit Protection Mode 3 when the application code needs to read from EEPROM.

### 9.9 ATmega2561 rev. E

No known errata.

# 9.10 ATmega2561 rev. D

Not sampled.

## 9.11 ATmega2561 rev. C

• High current consumption in sleep mode

## 1. High current consumption in sleep mode.

If a pending interrupt cannot wake the part up from the selected sleep mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

#### Problem Fix/Workaround

Before entering sleep, interrupts not used to wake the part from the sleep mode should be disabled.

## 9.12 ATmega2561 rev. B

Not sampled.

# 9.13 ATmega2561 rev. A

- Non-Read-While-Write area of flash not functional
- · Part does not work under 2.4 Volts
- Incorrect ADC reading in differential mode

#### 6. EEPROM read from application code does not work in Lock Bit Mode 3

When the Memory Lock Bits LB2 and LB1 are programmed to mode 3, EEPROM read does not work from the application code.

### Problem Fix/Workaround

Do not set Lock Bit Protection Mode 3 when the application code needs to read from EEPROM.

# 10. Datasheet Revision History

Please note that the referring page numbers in this section are referring to this document. The referring revision in this section are referring to the document revision.

### 10.1 Rev. 2549L-08/07

- 1. Updated note in Table 10-10 on page 47.
- 2. Updated Table 10-3 on page 42, Table 10-5 on page 43, Table 10-8 on page 46.
- 3. Updated typos in "DC Characteristics" on page 370.
- 4. Updated "Clock Characteristics" on page 374.
- 5. Updated "External Clock Drive" on page 374.
- 6. Added "System and Reset Characteristics" on page 375.
- 7. Updated "SPI Timing Characteristics" on page 377.
- 8. Updated "ADC Characteristics Preliminary Data" on page 379.
- 9. Updated ordering code in "ATmega640" on page 19.

### 10.2 Rev. 2549K-01/07

- 1. Updated Table 1-1 on page 3.
- 2. Updated "Pin Descriptions" on page 7.
- 3. Updated "Stack Pointer" on page 15.
- 4. Updated "Bit 1 EEPE: EEPROM Programming Enable" on page 35.
- 5. Updated Assembly code example in "Thus, when the BOD is not enabled, after setting the ACBG bit or enabling the ADC, the user must always allow the reference to start up before the output from the Analog Comparator or ADC is used. To reduce power consumption in Power-down mode, the user can avoid the three conditions above to ensure that the reference is turned off before entering Power-down mode" on page 63.
- 6: Updated "EIMSK External Interrupt Mask Register" on page 115.
- Updated Bit description in "PCIFR Pin Change Interrupt Flag Register" on page 116.
- 8. Updated code example in "USART Initialization" on page 211.
- 9. Updated Figure 26-8 on page 284.
- 10. Updated "DC Characteristics" on page 370.

#### 10.3 Rev. 2549J-09/06

- 1. Updated "Calibrated Internal RC Oscillator" on page 46.
- 2. Updated code example in "Moving Interrupts Between Application and Boot Section" on page 109.
- 3. Updated "Timer/Counter Prescaler" on page 187.

- 4. Updated "Device Identification Register" on page 304.
- 5. Updated "Signature Bytes" on page 340.
- 6. Updated "Instruction Set Summary" on page 419.

#### 10.4 Rev. 2549I-07/06

- 1. Added "Data Retention" on page 10.
- 2. Updated Table 16-3 on page 129, Table 16-6 on page 130, Table 16-8 on page 131, Table 17-2 on page 148, Table 17-4 on page 160, Table 17-5 on page 160, Table 20-3 on page 188, Table 20-6 on page 189 and Table 20-8 on page 190.
- 3. Updated "Fast PWM Mode" on page 150.

#### 10.5 Rev. 2549H-06/06

- 1. Updated "Calibrated Internal RC Oscillator" on page 46.
- 2. Updated "OSCCAL Oscillator Calibration Register" on page 50.
- 3. Added Table 31-1 on page 374.

#### 10.6 Rev. 2549G-06/06

- 1. Updated "Features" on page 1.
- 2. Added Figure 1-2 on page 3, Table 1-1 on page 3.
- 3. Updated "Calibrated Internal RC Oscillator" on page 46.
- 4. Updated "Power Management and Sleep Modes" on page 52.
- 5. Updated note for Table 12-1 on page 68.
- 6. Updated Figure 26-9 on page 285 and Figure 26-10 on page 285.
- 7. Updated "Setting the Boot Loader Lock Bits by SPM" on page 325.
- 8. Updated "Ordering Information" on page 19.
- 9. Added Package information "100C1" on page 25.
- 10. Updated "Errata" on page 28.

# 10.7 Rev. 2549F-04/06

- 1. Updated Figure 9-3 on page 29, Figure 9-4 on page 30 and Figure 1 on page 30.
- 2. Updated Table 20-2 on page 188 and Table 20-3 on page 188.
- 3. Updated Features in "ADC Analog to Digital Converter" on page 275.
- 4. Updated "Fuse Bits" on page 338.

#### 10.8 Rev. 2549E-04/06

- 1. Updated "Features" on page 1.
- 2. Updated Table 12-1 on page 62.
- 3. Updated note for Table 12-1 on page 62.
- 4. Updated "Bit 6 ACBG: Analog Comparator Bandgap Select" on page 272.
- 5. Updated "Prescaling and Conversion Timing" on page 278.
- 5. Updated "Maximum speed vs. V<sub>CC</sub>" on page 373.
- 6. Updated "Ordering Information" on page 19.

#### 10.9 Rev. 2549D-12/05

- 1. Advanced Information Status changed to Preliminary.
- 2. Changed number of I/O Ports from 51 to 54.
- Updatet typos in "TCCR0A Timer/Counter Control Register A" on page 129.
- 4. Updated Features in "ADC Analog to Digital Converter" on page 275.
- 5. Updated Operation in ADC Analog to Digital Converter" on page 275
- 6. Updated Stabilizing Time in "Changing Channel or Reference Selection" on page 282.
- 7. Updated Figure 26-1 on page 276, Figure 26-9 on page 285, Figure 26-10 on page 285.
- 8. Updated Text in "ADCSRB ADC Control and Status Register B" on page 291.
- 9. Updated Note for Table 4 on page 42, Table 13-14 on page 86, Table 26-3 on page 290 and Table 26-6 on page 296.
- 10. Updated Table 31-7 on page 379 and Table 31-8 on page 380.
- 11. Updated "Filling the Temporary Buffer (Page Loading)" on page 324.
- 12. Updated "Typical Characteristics" on page 387.
- 13. Updated "Packaging Information" on page 24.
- 14. Updated "Errata" on page 28.

# 10.10 Rev. 2549C-09/05

- 1. Updated Speed Grade in section "Features" on page 1.
- 2. Added "Resources" on page 10.
- 3. Updated "SPI Serial Peripheral Interface" on page 196. In Slave mode, low and high period SPI clock must be larger than 2 CPU cycles.
- 4. Updated "Bit Rate Generator Unit" on page 247.
- 5. Updated "Maximum speed vs. V<sub>CC</sub>" on page 373.
- Updated "Ordering Information" on page 19.
- 7. Updated "Packaging Information" on page 24. Package 64M1 replaced by 64M2.
- 8. Updated "Errata" on page 28.

# 10.11 Rev. 2549B-05/05

- 1. JTAG ID/Signature for ATmega640 updated: 0x9608.
- 2. Updated Table 13-7 on page 81.
- 3. Updated "Serial Programming Instruction set" on page 354.
- 4. Updated "Errata" on page 28.

## 10.12 Rev. 2549A-03/05

1. Initial version.
