## FEATURES

250 MSPS Update Rate
Low Glitch Impulse
Complete Composite Functions
Internal Voltage Reference
Single -5.2 V Supply

## APPLICATIONS

Raster Scan Displays
Color Graphics
Automated Test Equipment
TV Video Reconstruction

## GENERAL DESCRIPTION

The AD9701 is a high speed, 8-bit digital-to-analog converter with fully integrated composite video functions. High speed ECL input registers provide synchronous operation of data and control functions up to 250 MSPS.
The AD9701 incorporates onboard control functions including horizontal sync, blanking, reference white level and a $10 \%$ bright signal for highlighting. The setup level is also adjustable from 0 IRE units to 20 IRE units through the control pin. An internal voltage reference allows the AD9701 to operate as a stand-alone video reconstruction DAC.
The AD9701 is available as an industrial temperature range device, $-25^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$, and as an extended temperature range

FUNCTIONAL BLOCK DIAGRAM

device, $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$. Both grades of the AD9701 are packaged in a 22-pin ceramic DIP with the extended temperature device also available in a 28 -pin LCC package.

PIN CONFIGURATIONS

## NOTES

${ }^{1}$ Absolute maximum ratings are limiting values to be applied individually, and beyond which serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
${ }^{2}$ Typical thermal impedance . . .
22-Pin Ceramic $\quad \theta_{\mathrm{JA}}=64^{\circ} \mathrm{C} / \mathrm{W} ; \theta_{\mathrm{JC}}=16^{\circ} \mathrm{C} / \mathrm{W}$
28-Pin Ceramic LCC $\quad \theta_{\mathrm{JA}}=70^{\circ} \mathrm{C} / \mathrm{W} \quad \theta_{\mathrm{JC}}=21^{\circ} \mathrm{C} / \mathrm{W}$
${ }^{3}$ SYNC, BLANKING, and REFERENCE WHITE are inactive (Logic " 1 "). $\mathrm{I}_{\text {SET }} \approx 1.26 \mathrm{~V} / \mathrm{R}_{\text {SET }}$.
${ }^{4}$ All bits at logic HIGH.
${ }^{5}$ All values are relative to full-scale output after being normalized to nominal value. Typical variation in full-scale output from device to device can reach $\pm 10 \%$, for a fixed $\mathrm{R}_{\text {SET }}$ resistor.
${ }^{6}$ The effect of $10 \%$ BRIGHT algebraically adds to the output waveform.
${ }^{7}$ The output level with BLANKING active (Logic " 0 ") is determined by the setup control level.
${ }^{8}$ In normal operation, the BLANKING input is activated (Logic " 0 ") prior to or in conjunction with the SYNC input. The effect of the SYNC output is relative to the setup level.
${ }^{9}$ Measured from edge of STROBE to $50 \%$ transition point of the output signal.
${ }^{10}$ Measured with full-scale change in output level, from the $10 \%$ transition level to within $\pm 0.2 \%$ of the final output value.
${ }^{11}$ Measured from $10 \%$ to $90 \%$ transition point for full-scale step output.
${ }^{12} \mathrm{An}$ IRE unit is $1 \%$ of the Grey Scale (GS range) with a 0 IRE setup level.
${ }^{13}$ Supply Voltage should remain stable within $\pm 5 \%$ for normal operation.
${ }^{14}$ Measured at $\pm 5 \%$ of $-V_{S}$.
Specifications subject to change without notice.

GROUND

## Description

One of three ground returns. All grounds should be connected together near the AD9701.
Negative supply pin, nominally -5.2 V .
One of eight digital input bits. BIT 1 (MSB) is the most-significant-bit of the digital input word.
One of eight digital input bits.
One of eight digital input bits. BIT 8 (LSB) is the least-significant-bit of the digital input word.
Data and control register strobe input. STROBE is leading edge triggered.
One of three ground returns. All grounds should be connected together near the AD9701.
The SETUP input determines the position of the blanking level relative to the "reference black" IRE units to 20 IRE units be-

SETUP LEVEL
Units

0 IRE U it
$10 \%$ BRIGHT adds an additional current to the output level, equal to roughly $10 \%$ of the "grey scale" range. The $10 \%$ BRIGHT is active logic LOW and operates independently of all other inputs. The $\overline{\text { COMPOSITE BLANKING }}$ input, active logic LOW, forces output to the blanking level set with the SETUP input.
The COMPOSITE SYNC input, active LOW, creates a negative going horizontal synchronization pulse relative to the blanking level. Under normal operating conditions, the COMPOSITE
BLANKING signal should precede and extend past the COMPOSITE SYNC signal. See SETUP for additional information.
The REFERENCE WHITE input, active LOW, overrides the data inputs and forces the output to the maximum "grey scale" level.
The COMPENSATION input insures adequate gain stability for the internal reference amplifier. Under normal operating conditions, the COMPENSATION input is decoupled to ground through a $0.1 \mu \mathrm{~F}$ capacitor.
The CURRENT SET input determines the full-scale or "grey scale" range. The effects of the video control functions are in addition to the "grey scale" range. $\left(168 \Omega \leq \mathrm{R}_{\mathrm{SET}} \leq 600 \Omega\right)$.
$\mathrm{I}_{\mathrm{OUT} \max } \approx 4 \mathrm{I}_{\mathrm{SET}}=4\left(1.26 \mathrm{~V} / \mathrm{R}_{\mathrm{SET}}\right)$
Analog output.
One of three ground returns. All grounds should be connected together near the AD9701.

## APPLICATIONS INFORMATION

Raster scan video displays image data on a line by line basis, with timing and control signals inserted between the lines. The control signals include the horizontal synchronization pulses, which are used to align the display circuitry at the beginning of each line. After the complete video image is displayed on the monitor, the process begins again with the next image. The vertical reset pulse(s) that initiate this timing sequence are located between each video image.

Raster Graphics Configuration for TTL Systems
The image data is distinguished from the timing information by its location relative to the blanking level. The blanking reference level is at the blackest extreme of the image data and all timing
signals are designed to fall below the blanking level so as not to be seen on the monitor. The actual image data is located above the blanking level and it may be further separated from the timing signal by the setup level. The setup level is simply a buffer zone between the timing and image data.
Generation of the timing signals for the AD9701 is controlled by the $\overline{\text { COMPOSITE BLANKING }}$ and the COMPOSITE $\overline{S Y N C}$ inputs. In normal operation, the output level of the AD9701 is forced to the blanking level (black) with the $\overline{\mathrm{COM}}-$ POSITE BLANKING control so that when the synchronization occurs, it will not interfere (be seen) with the monitor image. The COMPOSITE SYNC control forces the output level below the blanking level, generating the synchronization pulse.
The "grey scale" is the image intensity range located above the blanking level by the amount of the setup level. The setup level is "reference black," the darkest displayable picture intensity. The top of the "grey scale" is "reference white" or the brightest picture intensity. As an 8-bit device, the AD9701 divides the "gray scale" into 256 individual levels.
Normal raster scan waveforms divide the region between the blanking level and reference white into 100 IRE units (International Radio Engineers). The setup level can range from 0 to 20 IRE units but typically is around 10 IRE units, and the synchronization pulse level typically falls 40 IRE units below the blanking level. For the AD9701, the reference white level is 10 IRE units below the full-scale output range ( $0 \mathrm{~mA}_{\mathrm{OUT}}$ ).
In terms of priority, the REFERENCE WHITE control overrides the data inputs, but both COMPOSITE SYNC and COMPOSITE BLANKING override the data inputs and the REFERENCE WHITE control. A fourth control is active at all times, $\overline{10 \%}$ BRIGHT, which adds approximately 10 IRE units to the output level no matter what the input state of the AD9701. The $\overline{10 \% \text { BRIGHT }}$ control is primarily used to highlight areas of the video image.
As with any high-speed device, the AD9701 requires a substantial low impedance ground plane and high quality ground connections to achieve the best performance. Performance can also be improved with adequate power supply decoupling near the supply pins of the AD9701. In ECL mode, the output of the AD9701 is designed to drive $75 \Omega$ cable directly, with $75 \Omega$ terminations to ground at both ends of the cable. For TTL configurations, the output should be terminated to +5.0 V through an $82 \Omega$ resistor (see circuit below).

Standard Reconstruction Configuration

## OUTLINE DIMENSIONS

Dimensions shown in inches and (mm).

28-Pin LCC

NOTES

1. THIS DIMENSION CONTROLS THE OVERALL PACKAGE THICKNESS 2. APPLIES TO ALL FOUR SIDES.
2. ALL TERMINALS ARE GOLD PLATED
