

SYNC separator IC with AFC

BA7062F

The BA7062F separates the synchronization signals from a video signal and outputs the horizontal and vertical synchronization signals (H_D and V_D), and the composite synchronization signal (Sync-out).

The H_D and V_D pulse widths are different.

● Applications

● Circuit operation

(1) Synchronization separation circuit

Detects the charging current to a externally-connected capacitor, and performs synchronization separation.

(2) Horizontal oscillation circuit

When a video signal is input, it is synchronized with Hsync by the PLL. The horizontal free-running frequency is determined by external resistor R₁.

$$f_{H-O} = \frac{2.05E6}{R_1} \text{ [kHz]}$$

(3) Vertical synchronization separation circuit

When a video signal is input, synchronization signal separation is done over the vertical synchronization pulse interval.

- (1) The rise and fall positions for V_D are basically the same for both odd and even fields.
- (2) H_D shifts by $1 / 2H$ during the odd and even field interval.

● Application example

* By configuring the circuit enclosed in the dotted line to that in the diagram on the right, you can decrease the lock-in time and increase the capture range.

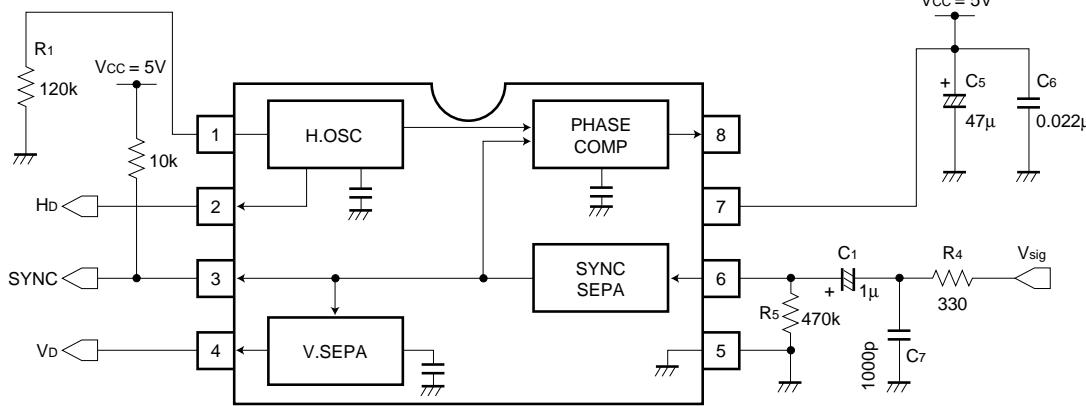

Fig. 10

- (1) Connect pin 1 to GND via a 120kΩ (approx.) resistor. Leave pins 2, 4 and 8 open.
- (2) SYNC output polarity (pin 3) is positive.
- (3) The delay time for rising edge of the SYNC output (pin 3) with respect to the falling edge of Sync for the Vsig input signal (pin 6) is 850ns (reference value).
- (4) The delay time for falling edge of the SYNC output (pin 3) with respect to the rising edge of Sync for the Vsig input signal (pin 6) is 450ns (reference value).
