

DAC0800/DAC0801/DAC0802 8-Bit Digital-to-Analog Converters

General Description

The DAC0800 series are monolithic 8-bit high-speed current-output digital-to-analog converters (DAC) featuring typical settling times of 100 ns. When used as a multiplying DAC, monotonic performance over a 40 to 1 reference current range is possible. The DAC0800 series also features high compliance complementary current outputs to allow differential output voltages of 20 V_{p-p} with simple resistor loads as shown in *Figure 1*. The reference-to-full-scale current matching of better than ± 1 LSB eliminates the need for full-scale trims in most applications while the nonlinearities of better than $\pm 0.1\%$ over temperature minimizes system error accumulations.

The noise immune inputs of the DAC0800 series will accept TTL levels with the logic threshold pin, V_{LC}, grounded. Changing the V_{LC} potential will allow direct interface to other logic families. The performance and characteristics of the device are essentially unchanged over the full ± 4.5 V to ± 18 V power supply range; power dissipation is only 33 mW with ± 5 V supplies and is independent of the logic input states.

The DAC0800, DAC0802, DAC0800C, DAC0801C and DAC0802C are a direct replacement for the DAC-08, DAC-08A, DAC-08C, DAC-08E and DAC-08H, respectively.

Features

- Fast settling output current 100 ns
- Full scale error ± 1 LSB
- Nonlinearity over temperature $\pm 0.1\%$
- Full scale current drift ± 10 ppm/ $^{\circ}$ C
- High output compliance -10 V to $+18$ V
- Complementary current outputs
- Interface directly with TTL, CMOS, PMOS and others
- 2 quadrant wide range multiplying capability
- Wide power supply range ± 4.5 V to ± 18 V
- Low power consumption 33 mW at ± 5 V
- Low cost

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its specified operating conditions.

Note 2: The maximum junction temperature of the DAC0800, DAC0801 and DAC0802 is 125°C. For operating at elevated temperatures, devices in the Dual-In-Line J package must be derated based on a thermal resistance of 100°C/W, junction-to-ambient, 175°C/W for the molded Dual-In-Line N package and 100°C/W for the Small Outline M package.

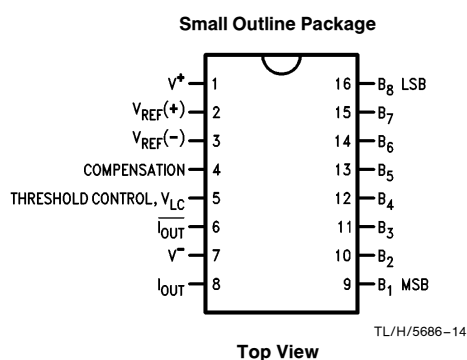

Note 3: Human body model, 100 pF discharged through a 1.5 kΩ resistor.

Note 4: Pin-out numbers for the DAC080X represent the Dual-In-Line package. The Small Outline package pin-out differs from the Dual-In-Line package.

Curve 2: $C_C = 15$ pF, $V_{IN} = 50$ mVp-p centered at 200 mV.
Curve 3: $C_C = 0$ pF, $V_{IN} = 100$ mVp-p at 0V and applied through 50 Ω connected to pin 14. 2V applied to pin 14.

Note. Positive common-mode range is always $(V+) - 1.5V$

TL/H/5686-3

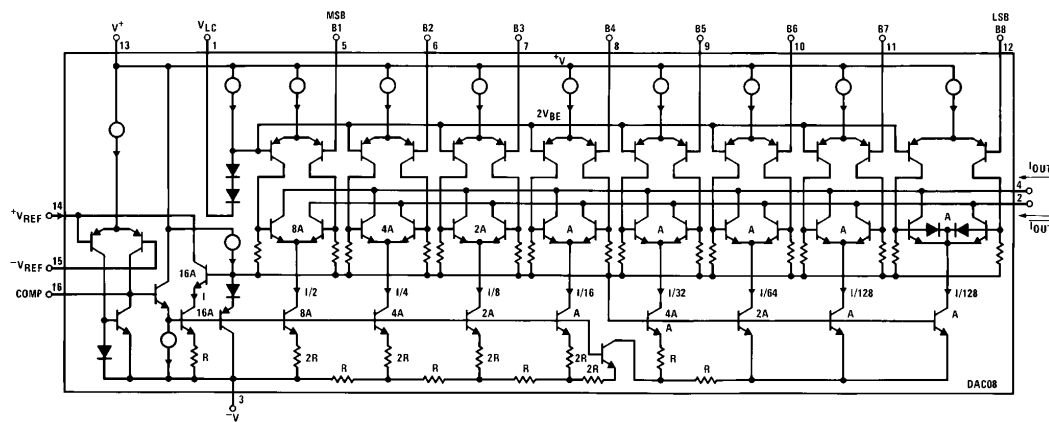

Note. B1-B8 have identical transfer characteristics. Bits are fully switched with less than $1/2$ LSB error, at less than ± 100 mV from actual threshold. These switching points are guaranteed to lie between 0.8 and 2V over the operating temperature range ($V_{LC} = 0V$).

$$I_0 + \bar{I}_0 = I_{FS} \text{ for all logic states}$$

For fixed reference, TTL operation, typical values are:

- $V_{REF} = 10.000V$
- $R_{REF} = 5.000k$
- $R_{15} \approx R_{REF}$
- $C_C = 0.01 \mu F$
