

FEATURES

- **Form, Fit, and Function Compatible with the Intel® 8044/8344**
- **Packaging options available: 40 Pin Plastic Dual In-Line Package (PDIP), 44 Pin Plastic Leaded Chip Carrier (PLCC)**
- **8-Bit Control Unit**
- **8-Bit Arithmetic-Logic Unit with 16-Bit multiplication and division**
- **12 MHz clock**
- **Four 8-Bit Input / Output ports**
- **Two 16-Bit Timer/Counters**
- **Serial Interface Unit with SDLC/HDLC compatibility**
- **2.4 Mbps maximum serial data rate**
- **Two Level Priority Interrupt System**
- **5 Interrupt Sources**
- **Internal Clock prescaler and Phase generator**
- **192 Bytes of Read/Write Data Memory Space**
- **64kB External Program Memory Space**
- **64kB External Data Memory Space**
- **4kB Internal ROM (IA8044 only)**

IA8044/IA8344 Variants

IA8044	4kB internal ROM with R0117 version 2.3 firmware, 192 byte internal RAM, 64kB external program and data space.
IA8344	192 byte internal RAM, 64kB external program and data space.

The IA8044/IA8344 is a "plug-and-play" drop-in replacement for the original IC. InnovASIC produces replacement ICs using its MILES™, or Managed IC Lifetime Extension System, cloning technology. This technology produces replacement ICs far more complex than "emulation" while ensuring they are compatible with the original IC. MILES™ captures the design of a clone so it can be produced even as silicon technology advances. MILES™ also verifies the clone against the original IC so that even the "undocumented features" are duplicated. This data sheet documents all necessary engineering information about the IA8044/IA8344 including functional and I/O descriptions, electrical characteristics, and applicable timing.

Package Pinout

DESCRIPTION

The IA8044/IA8344 is a form, fit and function compatible part to the Intel® 8X44 SDLC communications controller. The IA8044/IA8344 is a Fast Single-Chip 8-Bit Microcontroller with an integrated SDLC/HDLC serial interface controller. The IA8044/IA8344 is a fully functional 8-Bit Embedded Controller that executes all ASM51 instructions and has the same instruction set as the Intel 80C51. The IA8044/IA8344 can access the instructions from two types of program memory, serves software and hardware interrupts, provides an interface for serial communications and a timer system. The IA8044/IA8344 is fully compatible with the Intel® 8X44 series. The functional block diagram is shown below.

Functional Block Diagram

I/O Characteristics

The table below describes the I/O characteristics for each signal on the IC. The signal names correspond to the signal names on the pinout diagrams provided. The table below provides the I/O description of the IA8044 and the IA8344.

Name	Type	Description
RST	I	Reset. This pin when held high for two machine cycles while the oscillator is running will cause the chip to reset.
ALE	O	Address Latch Enable. Used to latch the address on the falling edge for external memory accesses.
PSEN	O	Program Store Enable. When low acts as an output enable for external program memory.
EA	I	External Access. When held low EA will cause the IA8044/IA8344 to fetch instructions from external memory.
P0.7 – P0.0	I/O	Port 0. 8 bit I/O port and low order multiplexed address/data byte for external accesses.
P1.7 – P1.0	I/O	Port 1. 8-bit I/O port. Two bits have alternate functions, P1.6 (RTS) and P1.7 (CTS).
P2.7 – P2.0	I/O	Port 2. 8-bit I/O port. It also functions as the high order address byte during external accesses.
P3.7 – P3.0	I/O	Port 3. 8-bit I/O port. Port 3 bits also have alternate functions as described below. P3.0 – RXD. Receive data input for SIU or direction control for P3.1 dependent upon datalink configuration. P3.1 – TXD. Transmit data output for SIU or data input/output dependent upon datalink configuration. Also enables diagnostic mode when cleared. P3.2 – INT0. Interrupt 0 input or gate control input for counter 0. P3.3 – INT1. Interrupt 1 input or gate control input for counter 1. P3.4 – T0. Input to counter 0. P3.5 – SCLK/T1. SCLK input to SIU or input to counter 1. P3.6 – WR. External memory write signal. P3.7 – RD. External memory read signal.
XTAL1	I	Crystal Input 1. Connect to VSS when external clock is used on XTAL2. May be connected to a crystal (with XTAL2), or may be driven directly with a clock source (XTAL2 not connected).
XTAL2	O	Crystal Input 2. May be connected to a crystal (with XTAL1), or may be driven directly with an inverted clock source (XTAL1 tied to ground).
VSS	P	Ground.
VCC	P	+5V power.

Memory Organization

Program Memory

Program Memory includes interrupt and Reset vectors. The interrupt vectors are spaced at 8-byte intervals, starting from 0003H for External Interrupt 0.

Reset Vectors

Location	Service
0003H	External Interrupt 0
000BH	Timer 0 overflow
0013H	External Interrupt 1
001BH	Timer 1 overflow
0023H	SIU Interrupt

These locations may be used for program code, if the corresponding interrupts are not used (disabled). The Program Memory space is 64K, from 0000H to FFFFH. The lowest 4K of program code (0000H to 0FFFH) can be fetched from external or internal Program Memory. This selection is made by strapping pin 'EA' (External Address) to GND or VCC. If during reset, 'EA' is held low, all the program code is fetched from external memory. If, during reset, 'EA' is held high, the lowest 4K of program code (0000H to 0FFFH) is fetched from internal memory (ROM). Program memory addresses above 4K (0FFFH) will cause the program code to be fetched from external memory regardless of the setting of 'EA'.

Data Memory

External Data Memory

The IA8044/IA8344 Microcontroller core incorporates the Harvard architecture, with separate code and data spaces. The code from external memory is fetched by 'psen' strobe, while data is read from RAM by bit 7 of P3 (read strobe) and written to RAM by bit 6 of P3 (write strobe). The External Data Memory space is active only by addressing through use of the MOVX instruction and the 16-bit Data Pointer Register (DPTR). A smaller subset of external data memory (8 bit addressing) may be accessed by using the MOVX instruction with register indexed addressing.

Internal Data Memory

The Internal Data Memory address is always 1 byte wide. The memory space is 192 bytes large (00H to BFH), and can be accessed by either direct or indirect addressing. The Special Function Registers occupy the upper 128 bytes. This SFR area is available only by direct addressing. Internal memory that overlaps the SFR address space is only accessible by indirect addressing.

Internal Memory

Bit Addressable Memory

Both the internal RAM and the Special Function Registers have locations that are bit addressable in addition to the byte addressable locations.

SFR Bit Addressable Locations

Byte Address	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0	Register
F0h	F7h	F6h	F5h	F4h	F3h	F2h	F1h	F0h	B

Instruction Set

The 8X44 architecture and instruction set are identical to the 8051's. The following tables give a survey of the instruction set of the IA8044/IA8344 Microcontroller core.

Arithmetic Operations

Mnemonic	Description	Byte	Cycle
ADD A,Rn	Add register to accumulator	1	1
ADD A, direct	Add direct byte to accumulator	2	1
ADD A,@Ri	Add indirect RAM to accumulator	1	1
ADD A,#data	Add immediate data to accumulator	2	1
ADDC A,Rn	Add register to accumulator with carry flag	1	1
ADDC A,direct	Add direct byte to A with carry flag	2	1
ADDC A,@Ri	Add indirect RAM to A with carry flag	1	1
ADDC A,#data	Add immediate data to A with carry flag	2	1
SUBB A,Rn	Subtract register from A with borrow	1	1
SUBB A,direct	Subtract direct byte from A with borrow	2	1
SUBB A,@Ri	Subtract indirect RAM from A with borrow	1	1
SUBB A,#data	Subtract immediate data from A with borrow	2	1
INC A	Increment accumulator	1	1
INC Rn	Increment register	1	1
INC direct	Increment direct byte	2	1
INC @ Ri	Increment indirect RAM	1	1
DEC A	Decrement accumulator	1	1
DEC Rn	Decrement register	1	1
DEC direct	Decrement direct byte	2	1
DEC @Ri	Decrement indirect RAM	1	1
INC DPTR	Increment data pointer	1	2
MUL A,B	Multiply A and B	1	4
DIV A,B	Divide A by B	1	4
DA A	Decimal adjust accumulator	1	1

Logic Operations

Mnemonic	Description	Byte	Cycle
ANL A,Rn	AND register to accumulator	1	1
ANL A,direct	AND direct byte to accumulator	2	1
ANL A,@Ri	AND indirect RAM to accumulator	1	1
ANL A,#data	AND immediate data to accumulator	2	1
ANL direct,A	AND accumulator to direct byte	2	1
ANL direct,#data	AND immediate data to direct byte	3	2
ORL A,Rn	OR register to accumulator	1	1
ORL A,direct	OR direct byte to accumulator	2	1
ORL A,@Ri	OR indirect RAM to accumulator	1	1
ORL A,#data	OR immediate data to accumulator	2	1
ORL direct,A	OR accumulator to direct byte	2	1
ORL direct,#data	OR immediate data to direct byte	3	2
XRL A,Rn	Exclusive OR register to accumulator	1	1
XRL A,direct	Exclusive OR direct byte to accumulator	2	1
XRL A,@Ri	Exclusive OR indirect RAM to accumulator	1	1
XRL A,#data	Exclusive OR immediate data to accumulator	2	1
XRL direct,A	Exclusive OR accumulator to direct byte	2	1
XRL direct,#data	Exclusive OR immediate data to direct byte	3	2
CLR A	Clear accumulator	1	1
CPL A	Complement accumulator	1	1
RL A	Rotate accumulator left	1	1
RLC A	Rotate accumulator left through carry	1	1
RR A	Rotate accumulator right	1	1
RRC A	Rotate accumulator right through carry	1	1
SWAP A	Swap nibbles within the accumulator	1	1

Data Transfer

Mnemonic	Description	Byte	Cycle
MOV A,Rn	Move register to accumulator	1	1
MOV A,direct	Move direct byte to accumulator	2	1
MOV A,@Ri	Move indirect RAM to accumulator	1	1
MOV A,#data	Move immediate data to accumulator	2	1
MOV Rn,A	Move accumulator to register	1	1
MOV Rn,direct	Move direct byte to register	2	2
MOV Rn,#data	Move immediate data to register	2	1
MOV direct,A	Move accumulator to direct byte	2	1
MOV direct,Rn	Move register to direct byte	2	2
MOV direct,direct	Move direct byte to direct byte	3	2
MOV direct,@Ri	Move indirect RAM to direct byte	2	2
MOV direct,#data	Move immediate data to direct byte	3	2
MOV @Ri,A	Move accumulator to indirect RAM	1	1
MOV @Ri,direct	Move direct byte to indirect RAM	2	2
MOV @ Ri, #data	Move immediate data to indirect RAM	2	1
MOV DPTR, #data16	Load data pointer with a 16-bit constant	3	2
MOVC A,@A + DPTR	Move code byte relative to DPTR to accumulator	1	2
MOVC A,@A + PC	Move code byte relative to PC to accumulator	1	2
MOVX A,@Ri	Move external RAM (8-bit addr.) to A	1	2
MOVX A,@DPTR	Move external RAM (16-bit addr.) to A	1	2
MOVX @Ri,A	Move A to external RAM (8-bit addr.)	1	2
MOVX @DPTR,A	Move A to external RAM (16-bit addr.)	1	2
PUSH direct	Push direct byte onto stack	2	2
POP direct	Pop direct byte from stack	2	2
XCH A,Rn	Exchange register with accumulator	1	1
XCH A,direct	Exchange direct byte with accumulator	2	1
XCH A,@Ri	Exchange indirect RAM with accumulator	1	1
XCHD X,@ Ri	Exchange low-order nibble indir. RAM with A	1	1

Boolean Manipulation

Mnemonic	Description	Byte	Cycle
CLR C	Clear carry flag	1	1
CLR bit	Clear direct bit	2	1
SETB C	Set carry flag	1	1
SETB bit	Set direct bit	2	1
CPL C	Complement carry flag	1	1
CPL bit	Complement direct bit	2	1
ANL C,bit	AND direct bit to carry flag	2	2
ANL C,bit	AND complement of direct bit to carry	2	2
ORL C,bit	OR direct bit to carry flag	2	2
ORL C,bit	OR complement of direct bit to carry	2	2
MOV C,bit	Move direct bit to carry flag	2	1
MOV bit,C	Move carry flag to direct bit	2	2

Program Branches

Mnemonic	Description	Byte	Cycle
ACALL addr11	Absolute subroutine call	2	2
LCALL addr16	Long subroutine call	3	2
RET Return	from subroutine	1	2
RETI Return	from interrupt	1	2
AJMP addr11	Absolute jump	2	2
LJMP addr16	Long jump	3	2
SJMP rel	Short jump (relative addr.)	2	2
JMP @A + DPTR	Jump indirect relative to the DPTR	1	2
JZ rel	Jump if accumulator is zero	2	2
JNZ rel	Jump if accumulator is not zero	2	2
JC rel	Jump if carry flag is set	2	2
JNC rel	Jump if carry flag is not set	2	2
JB bit,rel	Jump if direct bit is set	3	2
JNB bit,rel	Jump if direct bit is not set	3	2
JBC bit,rel	Jump if direct bit is set and clear bit	3	2
CJNE A,direct,rel	Compare direct byte to A and jump if not equal	3	2
CJNE A,#data,rel	Compare immediate to A and jump if not equal	3	2
CJNE Rn,#data rel	Compare immed. to reg. and jump if not equal	3	2
CJNE @Ri,#data,rel	Compare immed. to ind. and jump if not equal	3	2
DJNZ Rn,rel	Decrement register and jump if not zero	2	2
DJNZ direct,rel	Decrement direct byte and jump if not zero	3	2
NOP	No operation	1	1

Special Function Registers

The IA8044/IA8344 contains the following special function registers:

Symbol	Register Description	Byte Address(Hex)	Bit Addresses (Hex) (MSB - LSB)
ACC	Accumulator	E0h	E7h – E0h
B	B register	F0h	F7h – F0h
PSW	Program Status Word	D0h	D7h – D0h
SP	Stack Pointer	81h	-
DPH	Data Pointer High Byte	82h	-
DPL	Data Pointer Low Byte	83h	-
P0	Port 0	80h	87h – 80h
P1	Port 1	90h	97h – 90h
P2	Port 2	A0h	A7h – A0h
P3	Port 3	B0h	B7h – B0h
IP	Interrupt Priority	B8h	BCh – B8h
IE	Interrupt Enable	A8h	AFh, ACh – A8h
TMOD	Timer/Counter Mode	89h	-
TCON	Timer/Counter Control	88h	8Fh – 88h
TH0	Timer/Counter 0 high byte	8Ch	-
TL0	Timer/Counter 0 low byte	8Ah	-
TH1	Timer/Counter 1 high byte	8Dh	-
TL1	Timer/Counter 1 low byte	8Bh	-
SMD	Serial Mode	C9h	-
STS	SIU Status and Command	C8h	CFh – C8h
NSNR	SIU Send/Receive Count	D8h	DFh – D8h
STAD	SIU Station Address	CEh	-
TBS	Transmit Buffer Start Address	DCh	-
TBL	Transmit Buffer Length	DBh	-
TCB	Transmit Control Byte	DAh	-
RBS	Receive Buffer Start Address	CCh	-
RBL	Receive Buffer Length	CBh	-
RFL	Receive Field Length	CDh	-
RCB	Receive Control Byte	CAh	-
DMA CNT	DMA Count	CFh	-
FIFO	FIFO contents (3 bytes)	DF, DE, DDh	-
SIUST	SIU State Counter	D9h	-

Ports

Ports P0, P1, P2 and P3 are Special Function Registers. The contents of the SFR can be observed on corresponding pins on the chip. Writing a '1' to any of the ports causes the corresponding pin to be at high level (VCC), and writing a '0' causes the corresponding pin to be held at low level (GND).

All four ports on the chip are bi-directional. Each of them consists of a Latch (SFR P0 to P3), an output driver, and an input buffer, so the CPU can output or read data through any of these ports if they are not used for alternate purposes.

Ports P0, P1, P2 and P3 can perform some alternate functions. Ports P0 and P2 are used to access external memory. In this case, port 'p0' outputs the multiplexed lower 8 bits of address with 'ale' strobe high and then reads/writes 8 bits of data. Port P2 outputs the higher 8 bits of address. Keeping 'ea' pin low (tied to GND) activates this alternate function for ports P0 and P2.

Port P3 and P1 can perform some alternate functions. The pins of Port P3 are multifunctional. They can perform additional functions as described below.

Pin	Symbol	Function
P3.0	RxD, I/O	In point-to-point or multipoint configurations (SMD.3 = 0) this pin is I/O and signals the direction of data flow on DATA (P3.1). In loop mode (SMD.3 = 1) and diagnostic mode this pin is RxD, Receive Data input.
P3.1	TxD, DATA	In point to point or multipoint configurations (SMD.3 = 0) this pin is DATA and is the transmit/receive data pin. In loop mode (SMD.3 = 1) this pin is the transmit data, TxD, pin. Writing a '0' to this port buffer bit enables the diagnostic mode.
P3.2	INT0	External interrupt 0 input. Also gate control input for counter 0.
P3.3	INT1	External interrupt 1 input. Also gate control input for counter 1.
P3.4	T0	Timer/Counter 0 external input. Setting the appropriate bits in the Special Function Registers TCON and TMOD activates this function.
P3.5	T1, SCLK	Timer/Counter 1 external input. Setting the appropriate bits in the Special Function Registers TCON and TMOD activates this function. . Can also function as the external clock source for the SIU.
P3.6	WR	External Data Memory write strobe, active LOW. This function is activated by a CPU write access to External Data Memory (i.e. MOVX @DPTR, A).

- P3.7 RD External Data Memory read strobe, active LOW. This function is activated by a CPU read access from External Data Memory (i.e. MOVX A, @DPTR).
- P1.6 RTS Request To Send output, active low.
- P1.7 CTS Clear To Send input, active low.

Port Registers

Port 0 (P0):

General purpose, 8 bit, I/O port and multiplexed low order address and data bus with open-drain output buffers.

P0

Bit: 7	6	5	4	3	2	1	0
P0.7	P0.6	P0.5	P0.4	P0.3	P0.2	P0.1	P0.0

Port 1 (P1):

General purpose, 8 bit, I/O port with pullups and auxiliary functions.

P1

Bit: 7	6	5	4	3	2	1	0
RTS/P1.7	CTS/P1.6	P1.5	P1.4	P1.3	P1.2	P1.1	P1.0

- P1.0 -
- P1.1 -
- P1.2 -
- P1.3 -
- P1.4 -
- P1.5 -
- P1.6 RTS Request To Send output.
- P1.7 CTS Clear To Send input.

Port 2 (P2):

General purpose, 8 bit, I/O port with pullups and high order address bus.

P2

Bit: 7	6	5	4	3	2	1	0
P2.7	P2.6	P2.5	P2.4	P2.3	P2.2	P2.1	P2.0

Port 3 (P3):

General purpose, 8-bit I/O port with pullups and auxiliary functions. Bits on this port also functions as the SIU data transmit/receive I/O, external interrupt inputs, timer inputs and the read and write strobes for external memory accesses.

P3

Bit: 7	6	5	4	3	2	1	0
RD	WR	T1	T0	INT1	INT0	TxD	RxD

P3.0	RxD	Serial input pin.
P3.1	TxD	Serial output pin.
P3.2	INT0	External interrupt 0.
P3.3	INT1	External interrupt 1.
P3.4	T0	Timer/Counter 0 external input.
P3.5	T1	Timer/Counter 1 external input.
P3.6	WR	External Data Memory write strobe, active LOW.
P3.7	RD	External Data Memory read strobe, active LOW.

Timers/Counters

Timers 0 and 1

The IA8X44 has two 16-bit timer/counter registers: Timer 0 and Timer 1. Both can be configured for counter or timer operations. In timer mode, the register is incremented every machine cycle, which means that it counts up after every 12 oscillator periods. In counter mode, the register is incremented when the falling edge is observed at the corresponding input pin T0 or T1. Since it takes 2 machine cycles to recognize a 1-to-0 event, the maximum input count rate is 1/24 of the oscillator frequency. There are no restrictions on the duty cycle, however to ensure proper recognition of 0 or 1 state, an input should be stable for at least 1 machine cycle (12 clock periods).

Four operating modes can be selected for Timer 0 and Timer 1. Two Special Function Registers (TMOD and TCON) are used to select the appropriate mode.

Mode 0

In mode 0 the timers operate as an 8-bit timer (TH0/1) with a divide by 32 bit prescaler (TL0/1). Mode 0 uses all 8 bits of TH0/1 and the lower 5 bits of TL0/1. The upper 3 bits of TL0/1 are unknowns. Setting TR0/1 does not reset the registers TH0/1 and TL0/1. As the timer rolls over from all 1's to all 0's it will set the interrupt flag TF0/1.

Mode 1

Mode 1 is the same as mode 0 except that all 8 bits of TL0/1 are used instead of just the lower 5 bits.

Mode 2

Mode 2 configures TL0/1 as an 8-bit counter with automatic reload from the contents of TH0/1. Overflow of TL0/1 causes the interrupt TF0/1 to be set and the reload to occur. The contents of TH0/1 are not affected by the reload.

Mode 3

Mode 3 creates two separate 8 bit counters from TL0 and TH0. TL0 uses the timer 0 mode bits from TMOD, TMOD .0 through TMOD.3. TH0 is a timer only (not a counter) and uses timer 1's control bits, TR1 and TF1 for operation. Timer 1 can still be used if an interrupt is not required by switching it in and out of its own mode 3. With TMOD.4 and TMOD.5 both high timer 1 will stop and hold its count.

Timer Mode (TMOD):

The Timer Mode register contains bits that select the mode that the timers are to be operated in. The lower nibble controls timer 0 and the upper nibble controls timer 1.

TMOD

Bit: 7 6 5 4 3 2 1 0

GATE	C/T	M1	M0	GATE	C/T	M1	M0
------	-----	----	----	------	-----	----	----

TMOD.0

M0

Timer 0 mode selector bit.

TMOD.1	M1	Timer 0 mode selector bit.
TMOD.2	C/T	C/T Selects Timer0 or Counter0 operation. When set to 1, the Counter operation is performed, when cleared to 0, the register will function as a Timer.
TMOD.3	GATE	If set, enables external gate control for counter/timer0 (pin INT0/ for Counter 0). When INT0/ is high, and TR0 bit is set (see TCON register), the counter is incremented every falling edge on T0 input pin.
TMOD.4	M0	Timer 1 mode selector bit.
TMOD.5	M1	Timer 1 mode selector bit.
TMOD.6	C/T	C/T Selects Timer1 or Counter1 operation. When set to 1, the Counter operation is performed, when cleared to 0, the register will function as a Timer.
TMOD.7	GATE	If set, enables external gate control for counter/timer1 (pin INT1/ for Counter 1). When INT1/ is high, and TR1 bit is set (see TCON register), the counter is incremented every falling edge on T1 input pin..

Timer Mode Select Bits

M1	M0	Operating Mode
0	0	0 13 bit timer
0	1	1 16 bit timer/counter
1	0	2 8 bit auto-reload timer/counter
1	1	3 Timer0 – TL0 is a standard 8-bit timer/counter controlled by timer 0 control bits. TH0 is an 8-bit timer function only, controlled by timer 1 control bits.
1	1	3 Timer/counter1 stopped and holds its count. Can be used to start/stop timer 1 when timer 0 is in mode 3.

Timer Control (TCON):

The Timer Control register provides control bits that start and stop the counters. It also contains bits to select the type of external interrupt desired, edge or level. Additionally TCON contains status bits showing when a timer overflows and when an interrupt edge has been detected.

TCON

Bit: 7	6	5	4	3	2	1	0
TF1	TR1	TF0	TR0	IE1	IT1	IE0	IT0

TCON.0	IT0	Interrupt 0 type control bit. Selects falling edge or low level on input pin to cause interrupt.
TCON.1	IE0	Interrupt 0 edge flag. Set by hardware, when falling edge on external pin INT1/ is observed. Cleared when interrupt is processed.
TCON.2	IT1	Interrupt 1 type control bit. Selects falling edge or low level on input pin to cause interrupt.

TCON.3	IE1	Interrupt 1 edge flag. Set by hardware, when falling edge on external pin INT1/ is observed Cleared when interrupt is processed.
TCON.4	TR0	Timer 0 Run control bit. If cleared, Timer 0 stops.
TCON.5	TF0	Timer 0 overflow flag set by hardware when Timer 0 overflows. This flag should be cleared by software.
TCON.6	TR1	Timer 1 Run control bit. If cleared, Timer 1 stops. In mode 3 this bit controls TH0.
TCON.7	TF1	Timer 1 overflow flag set by hardware when Timer 1 overflows. This flag should be cleared by software.. In mode 3 this bit is controlled by TH0.

Timer 0 High byte (TH0):
 High order byte of timer/counter0.

TH0

Bit: 7	6	5	4	3	2	1	0
TH0.7	TH0.6	TH0.5	TH0.4	TH0.3	TH0.2	TH0.1	TH0.0

Timer 0 Low byte (TL0):
 Low order byte of timer/counter0.

TL0

Bit: 7	6	5	4	3	2	1	0
TL0.7	TL0.6	TL0.5	TL0.4	TL0.3	TL0.2	TL0.1	TL0.0

Timer 1 High byte (TH1):
 High order byte of timer/counter1.

TH1

Bit: 7	6	5	4	3	2	1	0
TH1.7	TH1.6	TH1.5	TH1.4	TH1.3	TH1.2	TH1.1	TH1.0

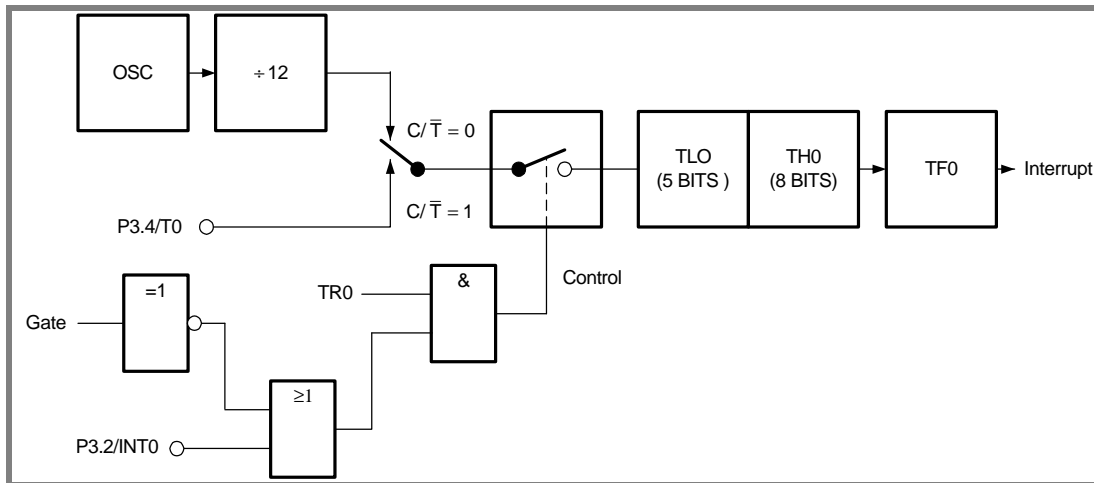

Timer 1 Low byte (TL1):
 Low order byte of timer/counter1.

TL1

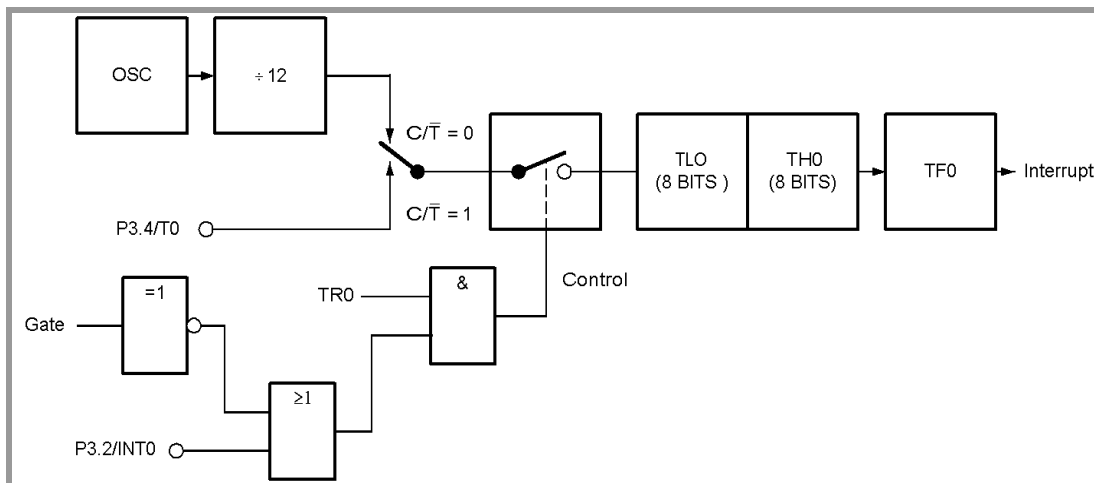

Bit: 7	6	5	4	3	2	1	0
TL1.7	TL1.6	TL1.5	TL1.4	TL1.3	TL1.2	TL1.1	TL1.0

Timers/Counters Configuration

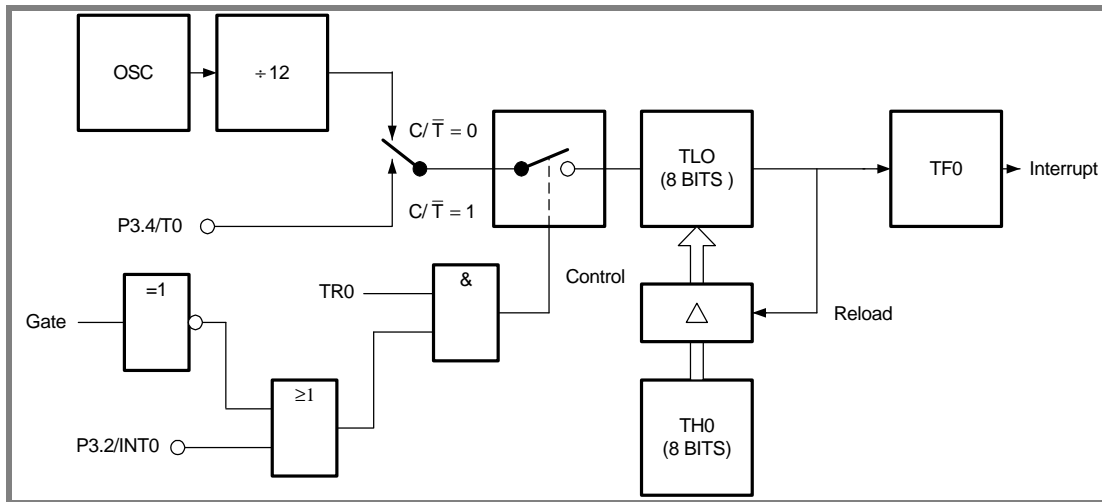

Timer 0 Mode 0

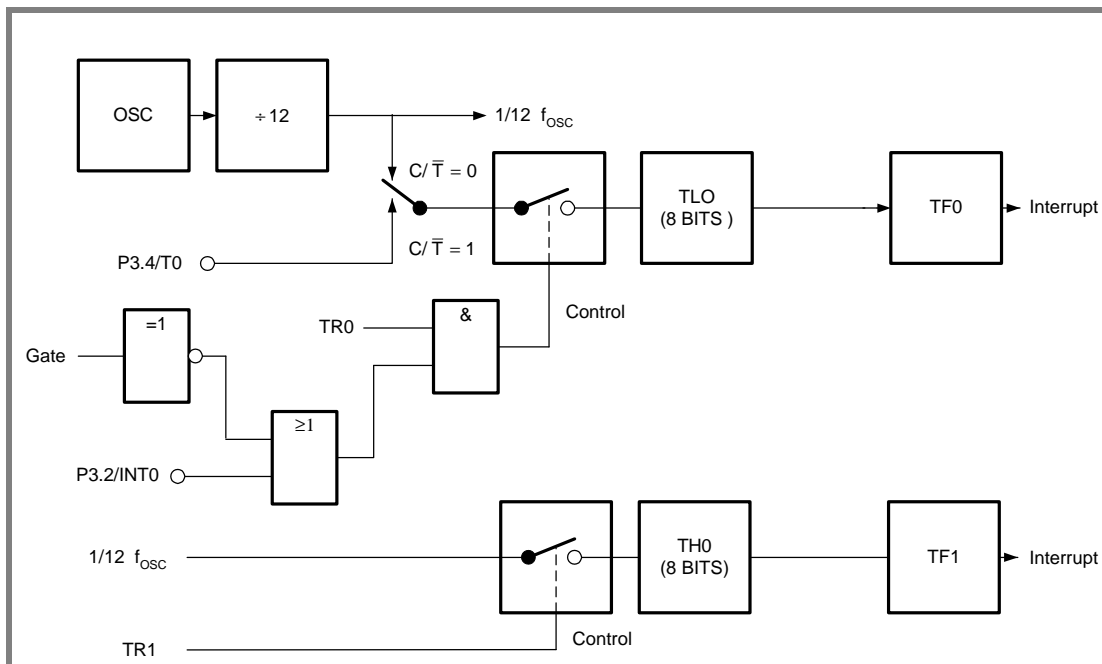

Timer 0 Mode 1

Timer 0 Mode 2

Timer 0 Mode 3

Reset

A reset is accomplished by holding the RST pin high for at least two machine cycles (24 oscillator periods) while the oscillator is running. The CPU responds by generating an internal reset, which is executed during the second cycle in which RST is high.

The internal reset sequence affects all SFRs as shown below. The internal reset sequence does not affect the contents of internal RAM.

Reset Values

Register	Reset value

General CPU Registers

Accumulator (ACC):

ACC is the Accumulator register. Most instructions use the accumulator to hold the operand. The mnemonics for accumulator-specific instructions refer to accumulator as A, not ACC.

ACC

Bit: 7	6	5	4	3	2	1	0
ACC.7	ACC.6	ACC.5	ACC.4	ACC.3	ACC.2	ACC.1	ACC.0

B register (B):

The B register is used during multiply and divide instructions. It can also be used as a scratch-pad register to hold temporary data.

B

Bit: 7	6	5	4	3	2	1	0
B.7	B.6	B.5	B.4	B.3	B.2	B.1	B.0

Program Status Word (PSW):

Contains CPU status flags, register select bits and user flags.

PSW

Bit: 7	6	5	4	3	2	1	0
CY	AC	F0	RS1	RS0	OV	-	P

PSW.0	P	Parity flag, affected by hardware to indicate odd / even number of “one” bits in the Accumulator, i.e. even parity.
PSW.1	-	User defined flag.
PSW.2	OV	Overflow flag.
PSW.3	RS0	Register bank select control bit 0, used to select working register bank.
PSW.4	RS1	Register bank select control bit 1, used to select working register bank.
PSW.5	F0	General purpose Flag 0 available for user.
PSW.6	AC	Auxiliary Carry flag for carry out of or into bit 3.
PSW.7	CY	Carry flag for carry out of or into bit 7.

The state of bits RS1, RS0 selects the working registers bank as follows:

RS1/0	Bank selected location
00	Bank 0 (00H – 07H)
01	Bank 1 (08H – 0FH)
10	Bank 2 (10H – 17H)
11	Bank 3 (18H – 1FH)

Stack Pointer (SP):

The Stack Pointer is a 1-byte register initialized to 07H after reset. This register is incremented before PUSH and CALL instructions, causing the stack to begin at location 08H. The stack pointer points to a location in internal RAM.

SP

Bit: 7	6	5	4	3	2	1	0
SP.7	SP.6	SP.5	SP.4	SP.3	SP.2	SP.1	SP.0

Data Pointer (DPTR):

The Data Pointer (DPTR) is 2 bytes wide. The lower part is DPL, and the highest is DPH. It can be loaded as 2 byte register (MOV DPTR,#data16) or as two registers (ea. MOV DPL,#data8). It is generally used to access external code or data space (ea. MOVC A,@A+DPTR or MOV A,@DPTR respectively).

DPH

Bit: 7	6	5	4	3	2	1	0
DPH.7	DPH.6	DPH.5	DPH.4	DPH.3	DPH.2	DPH.1	DPH.0

DPL

Bit: 7	6	5	4	3	2	1	0
DPL.7	DPL.6	DPL.5	DPL.4	DPL.3	DPL.2	DPL.1	DPL.0

Interrupts

The IA8044/IA8344 provides 5 interrupt sources. There are 2 external interrupts accessible through pins INT0 and INT1, edge or level sensitive (falling edge or low level). There are, also, internal interrupts associated with Timer 0 and Timer 1, and an internal interrupt from the SIU.

External Interrupts

The choice between external interrupt level or transition activity is made by setting IT1 and IT0 bits in the Special Function Register TCON.

When the interrupt event happens, a corresponding Interrupt Control Bit is set (IT0 or IT1). This control bit triggers an interrupt if the appropriate interrupt bit is enabled.

When the interrupt service routine is vectored, the corresponding control bit (IT0 or IT1) is cleared provided that the edge triggered mode was selected. If level mode is active, the external requesting source controls flags IT0 or IT1 by the logic level on pins INT0 or INT1 (0 or 1).

Timer0 and Timer 1 Interrupts

Timer 0 and 1 interrupts are generated by TF0 and TF1 flags, which are set by the rollover of Timer 0 and 1, respectively. When an interrupt is generated, the flag that caused this interrupt is cleared by the hardware, if the CPU accessed the corresponding interrupt service vector. This can be done only if this interrupt is enabled in the IE register.

Serial Interface Unit Interrupt

The SIU generates an interrupt when a frame is received or transmitted. No interrupts are generated for a received frame with errors.

Interrupt Priority Level Structure

There are two priority levels in the IA8044/IA8344, and any interrupt can be individually programmed to a high or low priority level. Modifying the appropriate bits in the Special Function Register IP can accomplish this. A low priority interrupt service routine will be interrupted by a high priority interrupt. However, the high priority interrupt can not be interrupted.

If two interrupts of the same priority level occur, an internal polling sequence determines which of them will be processed first. This polling sequence is a second priority structure defined as follows:

IE0 1 – highest
TF0 2
IE1 3
TF1 4
SIU – lowest

Interrupt Handling

The interrupt flags are sampled during each machine cycle. The samples are polled during the next machine cycle. If an interrupt flag is captured, the interrupt system will generate an LCALL instruction to the appropriate service routine, provided that this is not disabled by the following conditions:

1. An interrupt of the same or higher priority is processed
2. The current machine cycle is not the last cycle of the instruction (the instruction can not be interrupted).
3. The instruction in progress is RETI or any write to IE or IP registers.

Note that if an interrupt is disabled and the interrupt flag is cleared before the blocking condition is removed, no interrupt will be generated, since the polling cycle will not sample any active interrupt condition. In other words, the interrupt condition is not remembered. Every polling cycle is new.

Interrupt Priority Register (IP):

This register sets the interrupt priority to high or low for each interrupt. When the bit is set it selects high priority. Within each level the interrupts are prioritized as follows:

External interrupt 0
 Timer/counter 0
 External interrupt 1
 Timer/counter 1
 SIU.

An interrupt process routine cannot be interrupted by an interrupt of lesser or equal priority.

IP

Bit: 7	6	5	4	3	2	1	0
-	-	-	PS	PT1	PX1	PT0	PX0

IP.0	PX0	External Interrupt 0 interrupt priority bit.
IP.1	PT0	Timer 0. interrupt priority bit.
IP.2	PX1	External interrupt 1. interrupt priority bit.
IP.3	PT1	Timer 1 interrupt priority bit.
IP.4	PS	SIU interrupt priority bit.
IP.5	-	
IP.6	-	
IP.7	-	

Interrupt Enable Register (IE):

Contains the global interrupt enable bit and individual interrupt enable bits. Setting a bit enables the corresponding interrupt.

IE							
Bit: 7	6	5	4	3	2	1	0
EA	-	-	ES	ET1	EX1	ET0	EX0

PCON.0	EX0	External Interrupt 0 interrupt enable bit.
PCON.1	ET0	Timer 0. interrupt enable bit.
PCON.2	EX1	External interrupt 1. interrupt enable bit.
PCON.3	ET1	Timer 1 interrupt enable bit.
PCON.4	ES	SIU interrupt enable bit.
PCON.5	-	
PCON.6	-	
PCON.7	EA	Enable All interrupts bit.

SIU – Serial Interface Unit

The SIU is a serial interface customized to support SDLC/HDLC protocol. As such it supports Zero Bit insertion/deletion, flags automatic access recognition and a 16 bit CRC. The SIU has two modes of operation AUTO and FLEXIBLE. The AUTO mode uses a subset of the SDLC protocol implemented in hardware. This frees the CPU from having to respond to every frame but limits the frame types. In the FLEXIBLE mode every frame is under CPU control and therefore more options are available. The SIU is controlled by and communicates to the CPU by using several special function registers (SFRs). Data transmitted by or received by the SIU is stored in the 192 byte internal RAM in blocks referred to as the transmit and receive buffers. The SIU can support operation in one of three serial data link configurations: 1) half-duplex, point-to-point, 2) half-duplex, multipoint, 3) loop mode.

SIU Special Function Registers

The CPU controls the SIU and receives status from the SIU via eleven special function registers. The Serial Interface Unit Control Registers are detailed below:

Serial Mode Register (SMD):

The serial mode register sets the operational mode of the SIU. The CPU can read and write SMD. The SIU can read SMD. To prevent conflicts between CPU and SIU accesses to SMD the CPU should write SMD only when RTS and RBE bits in the STS register are both zero. SMD is normally only accessed during initialization. This register is byte addressable.

SMD

Bit: 7	6	5	4	3	2	1	0
SCM2	SCM1	SCM0	NRZI	LOOP	PFS	NB	NFCS

SMD.0	NFCS	When set selects No FCS field contained in the SDLC frame.
SMD.1	NB	Non-buffered mode. No control field contained in SDLC frame.
SMD.2	PFS	Pre-frame sync mode. When set causes two bytes to be transmitted before the first flag of the frame for DPLL synchronization. If NRZI is set 00H is transmitted otherwise 55H. This ensures that 16 transitions are sent before the opening flag.
SMD.3	LOOP	When set selects loop configuration else point-to-point mode.
SMD.4	NRZI	When set selects NRZI encoding otherwise NRZ.
SMD.5	SCM0	Select clock mode - bit 0.
SMD.6	SCM1	Select clock mode - bit 1.
SMD.7	SCM2	Select clock mode - bit 2.

SMD Select Clock Mode Bits

SCM	Clock Mode	Data Rate (Bits/sec)*
2 1 0		
0 0 0	Externally clocked	0 – 2.4M**
0 0 1	Undefined	
0 1 0	Self clocked, timer overflow	244 – 62.5K
0 1 1	Undefined	
1 0 0	Self clocked, external 16X	0 – 375K
1 0 1	Self clocked, external 32X	0 – 187.5K
1 1 0	Self clocked, internal fixed	375K
1 1 1	Self clocked, internal fixed	187.5K

* based on a 12 MHz crystal frequency
 ** 0 – 1M bps in loop configuration

Status/Command Register (STS):

The Status/Command register provides SIU control from and status to the CPU. The SIU can read the STS and can write certain bits in the STS. The CPU can read and write the STS. Accessing the STS by the CPU via 2 cycle instructions (JBC bit,rel and MOV bit,C) should not be used. STS is bit addressable.

STS

Bit: 7	6	5	4	3	2	1	0
TBF	RBE	RTS	SI	BOV	OPB	AM	RBP

STS.0	RBP	Receive buffer protect. When set prevents writing of data into the receive buffer. Causes RNR response instead of RR in AUTO mode.
STS.1	AM	Auto mode. Dual purpose bit depending upon the setting of bit NB (SMD.1). If NB is cleared, AM selects the AUTO mode when set, Flexible mode when clear. If NB is set, AM selects the addressed mode when set and the non-addressed mode when clear. The SIU can clear AM.
STS.2	OPB	Optional poll bit. When set the SIU will AUTO respond to an optional poll (UP with P=0). The SIU can set or clear the OPB.
STS.3	BOV	Receive buffer overrun. The SIU can set or clear BOV.
STS.4	SI	SIU interrupt. This bit is set by the SIU and should be cleared by the CPU before returning from the interrupt routine.
STS.5	RTS	Request to send. This bit is set when the SIU is ready to transmit or is transmitting. May be written by the SIU in AUTO mode. RTS is only applied to the external pin in non-loop mode. Can be thought of as a Transmit Enable. Note: RTS signal at the pin (P1.6) is the inverted version of this bit.

STS.6	RBE	Receive buffer empty. RBE is set by the CPU when it is ready to receive a frame or has just read the buffer. RBE is cleared by the SIU when a frame has been received. Can be thought of as a Receive Enable.
STS.7	TBF	Transmit buffer full. TBF is set by the CPU to indicate that the transmit buffer is ready and TBF is cleared by the SIU.

Send/Receive count register (NSNR):

The NSNR contains both the transmit and receive sequence numbers in addition to the tally error indications. The CPU can read and write the STS. Accessing the STS by the CPU via 2 cycle instructions (JBC bit,rel and MOV bit,C) should not be used. The SIU can read and write the NSNR. The NS and NR counters are not used in non-AUTO mode. NSNR is bit addressable.

NSNR

Bit: 7	6	5	4	3	2	1	0
NS2	NS1	NS0	SES	NR2	NR1	NR0	SER

NSNR.0	SER	Sequence error receive. NS (P) ? NR (S).
NSNR.1	NR0	Receive sequence counter, Bit 0.
NSNR.2	NR1	Receive sequence counter, Bit 1.
NSNR.3	NR2	Receive sequence counter, Bit 2.
NSNR.4	SES	Sequence error send. NR (P) ? NS (S) and NR (P) ? NS (S) + 1.
NSNR.5	NS0	Send sequence counter, Bit 0.
NSNR.6	NS1	Send sequence counter, Bit 1.
NSNR.7	NS2	Send sequence counter, Bit 2.

Station Address register (STAD):

The STAD contains the station address (node address) of the chip. The CPU can read or write STAD but should access STAD only when RTS = 0 and RBE = 0. Normally STAD is accessed only during initialization. STAD is byte addressable.

STAD

Bit: 7	6	5	4	3	2	1	0
STAD.7	STAD.6	STAD.5	STAD.4	STAD.3	STAD.2	STAD.1	STAD.0

Transmit Buffer Start Address Register (TBS):

The TBS contains the address in internal RAM where the frame (starting with the I-field) to be transmitted is stored. The CPU should access TBS only when the SIU is not transmitting a frame, TBF = 0. TBS is byte addressable.

TBS

Bit: 7	6	5	4	3	2	1	0
TBS.7	TBS.6	TBS.5	TBS.4	TBS.3	TBS.2	TBS.1	TBS.0

Transmit Buffer Length Register (TBL):

The TBL contains the length, in number of bytes, of the I-field to be transmitted. TBL = 0 is valid (no I-field). The CPU should access TBL only when the SIU is not transmitting a frame, TBF = 0. The transmit buffer will not wrap around after address 191 (BFH). A buffer end is automatically generated when address 191 is reached. TBL is byte addressable.

TBL

Bit: 7	6	5	4	3	2	1	0
TBL.7	TBL.6	TBL.5	TBL.4	TBL.3	TBL.2	TBL.1	TBL.0

Transmit Control Byte Register (TCB):

The TCB contains the byte to be placed in the control field of the transmitted frame during non-AUTO mode transmission. The CPU should access TCB only when the SIU is not transmitting a frame, TBF = 0. TCB is byte addressable.

TCB

Bit: 7	6	5	4	3	2	1	0
TCB.7	TCB.6	TCB.5	TCB.4	TCB.3	TCB.2	TCB.1	TCB.0

Receive Buffer Start Address Register (RBS):

The RBS contains the address in internal RAM where the frame (starting with the I-field) being received is to be stored. The CPU should write RBS only when the SIU is not receiving a frame, RBE = 0. RBS is byte addressable.

RBS

Bit: 7	6	5	4	3	2	1	0
RBS.7	RBS.6	RBS.5	RBS.4	RBS.3	RBS.2	RBS.1	RBS.0

Receive Buffer Length Register (RBL):

The RBL contains the length, in number of bytes, of the I-field storage area in internal RAM. RBL = 0 is valid (no I-field). The CPU should write RBL only when the SIU is not receiving a frame, RBE = 0. The receive buffer will not wrap around after address 191 (BFH). A buffer end is automatically generated when address 191 is reached. RBL is byte addressable.

RBL

Bit: 7	6	5	4	3	2	1	0
RBL.7	RBL.6	RBL.5	RBL.4	RBL.3	RBL.2	RBL.1	RBL.0

Receive Field Length Register (RFL):

The RFL contains the length, in number of bytes, of the I-field of the frame received and stored in internal RAM. RFL = 0 is valid (no I-field). The CPU should access RFL only when the SIU is not receiving a frame, RBE = 0. RFL is loaded by the SIU. RFL is byte addressable.

RFL

Bit: 7	6	5	4	3	2	1	0
RFL.7	RFL.6	RFL.5	RFL.4	RFL.3	RFL.2	RFL.1	RFL.0

Receive Control Byte Register (RCB):

The RCB contains the control field of the frame received and stored in internal RAM. RCB is only readable by the CPU and the CPU should access RCB only when the SIU is not receiving a frame, RBE = 0. RCB is loaded by the SIU. RCB is byte addressable.

RCB

Bit: 7	6	5	4	3	2	1	0
RCB.7	RCB.6	RCB.5	RCB.4	RCB.3	RCB.2	RCB.1	RCB.0

DMA Count Register (DMA CNT):

The DMA CNT register contains the number of bytes remaining for the information field currently being used. This register is an ICE support register. DMA CNT is byte addressable.

DMA CNT

Bit: 7	6	5	4	3	2	1	0
DMA CNT.7	DMA CNT.6	DMA CNT.5	DMA CNT.4	DMA CNT.3	DMA CNT.2	DMA CNT.1	DMA CNT.0

DMA Count Register (FIFO):

The FIFO register is actually three registers that make a three byte FIFO. These are used as temporary storage between the eight bit shift register and the receive buffer when an information field is received. This register is an ICE support register. FIFO is byte addressable.

FIFO

Bit: 7	6	5	4	3	2	1	0
FIFO*.7	FIFO*.6	FIFO*.5	FIFO*.4	FIFO*.3	FIFO*.2	FIFO*.1	FIFO*.0

* = 1, 2 or 3 for FIFO1, FIFO2, FIFO3 respectively.

SIU State Counter (SIUST):

The SIUST register indicates which state the SIU state machine is currently in. This in turn indicates what task the SIU is performing or which field is expected next by the SIU. This register should not be written to. This register is an ICE support register. SIUST is byte addressable.

SIUST

Bit: 7	6	5	4	3	2	1	0
SIUST .7	SIUST .6	SIUST .5	SIUST .4	SIUST .3	SIUST .2	SIUST .1	SIUST .0

Data Clocking Options

The SIU may be clocked in one of two ways, with an external clock or in a self-clocked mode.

In the external clocked mode a serial clock must be provided on SCLK. This clock must be synchronized to the serial data. Incoming data is sampled at the rising edge of SCLK. Outgoing data is shifted out at the falling edge of SCLK.

In the self-clocked mode the SIU uses a reference clock and the serial data to reproduce the serial data clock. The reference clock can be an external source applied to SCLK, the IA8044/IA8344's internal clock or the timer 1 overflow. The reference clock must be 16x or 32x the data rate. A DPLL uses the reference clock and the serial data to adjust the sample time to the center of the serial bit. It does this by adjusting from a serial data transition in increments of 1/16 of a bit time.

The maximum data rate in the externally clocked mode is 2.4Mbps in a point-to-point configuration and 1.0Mbps in a loop configuration. With a 12 MHz cpu clock the maximum data rate in the self-clocked mode with an external clock is 375Kbps. The maximum data rate in the self-clocked mode with an internal clock will depend on the frequency of the IA8044/IA8344's input clock. An IA8044/IA8344 using a 12MHz input clock can operate at a maximum data rate of 375Kbps.

The Serial mode register bits 5, 6, and 7 select the clocking option for the SIU. (see SMD register description)

Operational Modes

The SIU operates in one of two modes, AUTO or FLEXIBLE. The mode selected determines how much intervention is required by the CPU when receiving and transmitting frames. In both modes short frames, aborted frames, and frames with CRC errors will be ignored.

AUTO mode allows the SIU to recognize and respond to specific SDLC frames without the CPU's intervention. This provides for a faster turnaround time but restricts the operation of the SIU. When in AUTO mode the SIU can only act as a normal response secondary station and responses will adhere to IBM's SDLC definitions.

When receiving in the AUTO mode the SIU receives the frame and examines the control byte. It will then take the appropriate action for that frame. If the frame is an information frame the SIU will load the receive buffer, interrupt the CPU and make the required response to the primary station. The SIU in AUTO mode can also respond to the following commands from the primary station.

RR (Receive ready),
RNR (Receive Not Ready),
REJ (Reject),
UP (Unnumbered Poll) also called NSP (Non-Sequenced Poll) or ORP (Optional Response Poll).

In AUTO mode when the transmit buffer is full the SIU can transmit an information frame when polled for information. After transmission the SIU waits for acknowledgement from the receiving

station. If the response is positive the SIU interrupts the CPU. If the response is negative the SIU retransmits the frame. The SIU can send the following responses to the primary station.

RR (Receive Ready),
RNR (Receive Not Ready).

The FLEXIBLE mode requires the CPU to control the SIU for both transmitting and receiving. This slows response time but allows full SDLC and limited HDLC compatibility as well as variations. In FLEXIBLE mode the SIU can act as a primary station. The SIU will interrupt the CPU after completion of a transmission without waiting for a positive acknowledgement from the receiving station.

Basic SDLC Frame

FLAG	ADDRESS	CONTROL	INFORMATION	FCS	FLAG
------	---------	---------	-------------	-----	------

IA8X44 Frame parameters:

Flag - 8 bits
Address - 8 bits
Control - 8 bits
Information - n bytes (where $n \leq 192$)
FCS - 16 bits
Flag - 8 bits

Frame Format Options

The various frame formats available with the IA8044/IA8344 are the standard SDLC format, the no control field format, the no control field and no address field format and the no FCS field format.

The standard SDLC format consists of an opening flag, an 8-bit address field, an 8-bit control field, and n-byte information field, a 16-bit frame check sequence field and a closing flag. The FCS is generated by the CCIT-CRC polynomial ($X^{16} + X^{12} + X^5 + 1$). The FCS is calculated on the address, control and information fields. The address and control fields may not be extended. The address is contained in STAD and the control field is contained in either RCB or TCB. This format is supported by both AUTO and FLEXIBLE modes.

The no control field format is only supported by the FLEXIBLE mode. In this format TCB and RCB are not used and the information field starts immediately after the address field. A control field may still be used in the frame but the SIU will treat it as a byte of the information field.

The no control field and no address field format is only supported by the FLEXIBLE mode. In this format STAD, TCB and RCB are not used and the information field starts immediately after the opening flag. This option can only be used with the no control field option. Again a control field and address field may still be used in the frame but the SIU will treat each as a byte of the information field.

The no FCS field format prevents an FCS from being generated during transmission or being checked during reception. This option may be used in conjunction with the other frame format options. This option will work with both FLEXIBLE and AUTO modes. In AUTO mode it could cause protocol violations. An FCS field may still be used in the frame but the SIU will treat it as a byte of the information field.

All the possible Frame Format combinations are shown in the table below along with the bit settings that select a given format.

Frame Format Options

Frame Option	NFCS	NB	AM	Frame Format
Standard SDLC FLEXIBLE Mode	0	0	0	Fl Ad Co Inf FCS Fl
Standard SDLC AUTO Mode	0	0	1	Fl Ad Co Inf FCS Fl
No Control Field FLEXIBLE Mode	0	1	1	Fl Ad Inf FCS Fl
No Control Field No Address Field FLEXIBLE Mode	0	1	0	Fl Inf FCS Fl
No FCS Field FLEXIBLE Mode	1	0	0	Fl Ad Co Inf Fl
No FCS Field AUTO Mode	1	0	1	Fl Ad Co Inf Fl
No Control Field No FCS Field FLEXIBLE Mode	1	1	1	Fl Ad Inf Fl
No Control Field No Address Field No FCS Field FLEXIBLE Mode	1	1	0	Fl Inf Fl
Fl -> Flag Ad -> Address Field Co -> Control Field Inf -> Information Field FCS -> Frame Check Sequence				

HDLC Restrictions

The IA8044/IA8344 supports a subset of the HDLC protocol. The differences include the restriction by the IA8044/IA8344 of the serial data to be in 8-bit increments. In contrast HDLC allows for any number of bits in the information field. HDLC provides an unlimited address field and an extended frame number sequencing. HDLC does not support loop configuration.

SIU Details

The SIU is composed of two functional blocks with each having several sub blocks. The two blocks are called the bit processor (BIP) and the byte processor (BYP).

Bit and Byte Processors

BIP

The BIP consists of the DPLL, NRZI encoder/decoder, serial/parallel shifter, zero insertion/deletion, shutoff logic and FCS generation/checking. The NRZI logic compares the current bit to the previous bit to determine if the bit should be inverted. The serial shifter converts the outgoing byte data to bit data and incoming bit data to byte data. The zero insert/delete circuitry inserts and deletes zeros and also detects flags(01111110), go-aheads (GA) (01111111) and aborts (1111111). The pattern 11111110 is detected as an early go-ahead that can be turned into a flag in loop configurations. The shutoff detector is a three bit counter that is used to detect a sequence of eight zeros, which is the shutoff command in loop mode transmissions. It is cleared whenever a one is detected. The FCS logic performs the generation and checking of the FCS value according to the polynomial described above. The FCS register is set to all 1's prior to each calculation. If a CRC error is generated on a receive frame the SIU will not interrupt the CPU and the error will be cleared upon receiving an opening flag.

BYP

The BYP contains registers and controllers used to perform the manipulations required for SDLC communications. The BYP registers may be accessed by the CPU (see SFR section above). The BYP contains the SIU state machine that controls transmission and reception of frames.

Diagnostics

A diagnostic mode is included with the IA8044/IA8344 to allow testing of the SIU. Diagnostics use port pins P3.0 and P3.1. Writing a 0 to P3.1 enables the diagnostic mode. When P3.1 is cleared writing data to P3.0 has the effect of writing a serial data stream to the SIU. P3.0 is the serial data and any write to port 3 will clock SCLK. The transmit data may be monitored on P3.1 with any write to port 3 again clocking SCLK. In the test mode P3.0 and P3.1 pins are placed in the high impedance state.

Diagnostic Signal Routing

AC/DC Parameters

Absolute Maximum Ratings:

Ambient temperature under bias.....	-40°C to +85°C
Storage temperature.....	- 40°C to 150°C
Power Supply (V _{DD}).....	-0.3 to +6VDC
Voltage on any pin to VSS.....	-0.3 to (V _{DD} +0.3) - See Note 1
Power dissipation.....	2W

DC Characteristics

Symbol	Parameter	Min	Typ	Max	Unit
VIL	Input Low Voltage	-	-	0.8	V
VIH	Input High Voltage	2.0	-	-	V
VOL	Output Low Voltage (IOL= 4mA)	-	-	0.4	V
VOH	Output High Voltage (IOH= 4mA)	3.5	-	-	V
RPU	Pull-Up Resistance (Ports 1,2,3)	-	50	-	KΩ
RPD	Pull-Down Resistance (RST)	-	50	-	KΩ
IIL	Input Low Current (Ports 1, 2, 3)	-100		1	μA
IIL1	Input Low Current (all other inputs)	-1		1	μA
IIH	Input High Current (RST)	-1	-	100	μA
IIH1	Input High Current (all other inputs)	-1		1	μA
IOZ	Tri-state Leakage Current (Port 0,1,2,3)	-10		10	μA
ICC	Power Supply Current (@ 12 MHz)			50	mA
CIO	Pin Capacitance	-	4	-	pF

Notes:

1. This device does not contain EPROM or it's related programming circuitry. Therefore this limit must be adhered to especially for input pin EA that in the Intel device is used as the programming voltage pin. Exceeding the listed maximum voltage will cause damage to the device.

A.C. Characteristics

$T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$, $V_{DD} = 5\text{V} \pm 10\%$, $V_{SS} = 0\text{V}$, Load Capacitance = 87pF

External Program Memory Characteristics

Symbol	Parameter	12 MHz Osc		Variable Clock 1/TCLCL = 3.5 MHz TO 12 MHz		Unit
		Min	Max	Min	Max	
TLHLL	ALE Pulse Width	171		2TCLCL+4		ns
TAVLL	Address Valid to ALE Low	75		TCLCL-8		ns
TLLAX	Address Hold After ALE Low	74		TCLCL-9		ns
TLLIV	ALE Low to Valid Instr. In.		298		4TCLCL-35	ns
TLLPL	ALE Low to PSEn Low	83		TCLCL		ns

• **Errata**

Errata data listed for a particular version of the device apply only to that version. If errata data applies to more than one version it will be listed under each version affected. Errata data that applies to all versions is listed under the heading "Version ALL". InnovASIC devices are manufactured as prototypes and production units. Prototype versions are denoted as 'PXX' and production versions are denoted as 'XX' with XX being the version number (i.e. 03).

Version ALL:

ISSUE: Cannot read internal ROM with EPROM verification method.
SOLUTION: Must use alternate method to read internal ROM. The IA8X44 does not contain internal EPROM and therefore does not support the EPROM read feature.

ISSUE: The IA8X44 has a different pullup value than the Intel version. The Intel version can source more current than the IA8X44.
SOLUTION: Adjust external circuits if necessary.

Version P00:

ISSUE: Incorrect version of Intel 8044 code in internal ROM. Internal ROM contains version 2.1 it should contain version 2.3.
SOLUTION: Version 2.3 ROM code must be run from external memory. Future versions of device will contain version 2.3.

ISSUE: The JMP @A+DPTR instruction incorrectly adds carry out of lower byte into higher byte of calculated PC value (was using carry as if the @A was a signed value, should be an absolute value).
SOLUTION: Avoid use of this instruction or modify code to account for error. Future versions of device will execute this instruction correctly.

ISSUE: When using edge sensitive interrupts the device may miss an interrupt. The problem occurs when enabling the interrupts or when TCON is being written to.
SOLUTION: Change to level sensitive interrupts or use external registers for INT0/1.

ISSUE: Reads from unused internal locations return 00h. when they should return FFh except for two locations which should return 00h.
SOLUTION: Avoid reading unused locations or mask the value from unused locations.

ISSUE: Setting IE0 or IE1 in TCON does not force an interrupt when in level sensitive mode.
SOLUTION: Use edge sensitive mode for these two interrupt sources.

ISSUE: Port2 buffer bits set high are not actively driven when executing a MOVX A,@Ri or a MOVX @Ri,A instruction. During these instructions any bit that was driven low by the previous value on Port2 but is high in the Port2 buffer will not reach a valid high level before ALE goes low.

SOLUTION: Avoid the use of these instructions or add strong pullups (approximately 10K) to Port2 externally.

ISSUE: Race condition on transmit response in AUTO mode causes bad control byte to be transmitted..

SOLUTION: In firmware wait for RTS=1 before telling transmit to start.

ISSUE: Device does not sense the end of buffer during a receive.

SOLUTION: No workaround available.

ISSUE: Receiving continuous flags (7Eh) while in loop mode will not allow a slave device to transmit. The device is only able to transmit when the line is idle.

SOLUTION: Do not send continuous flags.

Version 00/P01:

ISSUE: The following registers change value after an external reset, STAD, TBS, TBL, TCB, RBS, RBL, RFL, and RCB. These registers should retain there pre-reset values.

SOLUTION: Store register values in memory (internal or external) to be restored after reset.

ISSUE: Device may miss external interrupts with narrow pulse widths when in edge sensitive mode and tight software loops that check TCON.

SOLUTION: Place NOPs in loop to allow time to capture interrupt..

ISSUE: Intermittent drop out in slave mode, followed by normal operation. Dropouts can be caused by either noise on the reset pin or XTAL1 being unconnected when using a clock source.

SOLUTION: Filter reset if necessary. Ensure that XTAL1 is tied low when using a clock source.

ISSUE: When used as a slave in loop mode the device may misinterpret a byte due to an internal bit counter error. This may cause the device to think it has seen a go-ahead and can transmit when it actually should not transmit.

SOLUTION: No workaround available.

ISSUE: If the synchronous mode is used (external SCLK is provided), gating off the SCLK may cause the device to communicate erratically. Depending on when the SCLK is gated off the SIU may not have finished its present task. When the SCLK is restarted the device may not respond to communications.

SOLUTION: Do not gate off the external SCLK.

ISSUE: The chip does not operate properly, showing intermittent errors. Difficulty with accessing external memory. The signals used to access external memory do not have the correct timing.

SOLUTION: Adjust signal timing externally if possible.

ISSUE: The device exhibits a 24MHz ripple on output pins. Clock/Osc switching causes noise to be induced onto power rails.

SOLUTION: No workaround available.

ISSUE: The chip fails when placed in emulators. ALE and PSEN do not tristate during reset.

SOLUTION: No workaround available.
