Description

The Hitachi HM5164165 Series, HM5165165 Series are 64M-bit dynamic RAMs organized as 4,194,304-word × 16-bit. They have realized high performance and low power by employing CMOS process technology. HM5164165 Series, HM5165165 Series offer Extended Data Out (EDO) Page Mode as a high speed access mode. They have the package variations of standard 50-pin plastic SOJ and standard 50-pin plastic TSOPII

Features

- Single 3.3 V supply: 3.3 V ± 0.3 V
- Access time: 50 ns/60 ns (max)
- Power dissipation
 - Active: 432 mW/396 mW (max) (HM5164165 Series)
: 504 mW/432 mW (max) (HM5165165 Series)
 - Standby : 1.8 mW (max) (CMOS interface)
: 0.54 mW (max) (L-version)
- EDO page mode capability
- Refresh cycles
 - $\overline{\text{RAS}}$ -only refresh
 - 8192 cycles/64 ms (HM5164165)
/128 ms (HM5164165L) (L-version)
 - 4096 cycles/64 ms (HM5165165)
/128 ms (HM5165165L) (L-version)
 - CBR/Hidden refresh
 - 4096 cycles/64 ms (HM5164165, HM5165165)
/128 ms (HM5164165L, HM5165165L) (L-version)

Preliminary: The Specifications of this device are subject to change without notice. Please contact to your nearest Hitachi's sales Dept. regarding specifications

HM5164165 Series, HM5165165 Series

- 4 variations of refresh
 - $\overline{\text{RAS}}$ -only refresh
 - $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh
 - Hidden refresh
 - Self refresh (L-version)
- $2\overline{\text{CAS}}$ -byte control
- Battery backup operation (L-version)

H to L	L	L	H	×	High-Z	High-Z	
L	L	L	H	H	High-Z	High-Z	Read cycle (Output disabled)

- Notes: 1. H: V_{IH} (inactive) L: V_{IL} (active) ×: V_{IH} or V_{IL}
 2. $t_{wCS} \geq 0$ ns: Early write cycle
 $t_{wCS} < 0$ ns: Delayed write cycle
 3. Mode is determined by the OR function of the \overline{UCAS} and \overline{LCAS} . (Mode is set by the earliest of \overline{UCAS} and \overline{LCAS} active edge and reset by the latest of \overline{UCAS} and \overline{LCAS} inactive edge.) However write operation and output High-Z control are done independently by each \overline{UCAS} , \overline{LCAS} .
 ex. if $\overline{RAS} = H$ to L, $\overline{LCAS} = L$, $\overline{UCAS} = H$, then \overline{CAS} -before- \overline{RAS} refresh cycle is selected.

\overline{CAS} hold time (self refresh)	t_{CHS}	-50	—	-50	—	ns	30

Notes: 1. AC measurements assume $t_T = 2$ ns.

- An initial pause of 200 μ s is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing \overline{RAS} -only refresh or \overline{CAS} -before- \overline{RAS} refresh).
- Operation with the t_{RCD} (max) limit insures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (max) limit, then the access time is controlled exclusively by t_{CAC} .
- Operation with the t_{RAD} (max) limit insures that t_{RAC} (max) can be met, t_{RAD} (max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (max) limit, then access time is controlled exclusively by t_{AA} .
- Either t_{OED} or t_{CDD} must be satisfied.
- Either t_{DZO} or t_{DZC} must be satisfied.
- V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} (min) and V_{IL} (max).
- Assumes that t_{RCD} t_{RCD} (max) and t_{RAD} t_{RAD} (max). If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
- Measured with a load circuit equivalent to 1 TTL loads and 100 pF.
- Assumes that t_{RCD} t_{RCD} (max) and $t_{RCD} + t_{CAC}$ (max) $t_{RAD} + t_{AA}$ (max).
- Assumes that t_{RAD} t_{RAD} (max) and $t_{RCD} + t_{CAC}$ (max) $t_{RAD} + t_{AA}$ (max).
- Either t_{RCH} or t_{RRH} must be satisfied for a read cycles.
- t_{OFF} (max), t_{OEZ} (max), t_{WEZ} (max) and t_{OFF} (max) define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
- t_{WCS} , t_{RWD} , t_{CWD} , t_{AWD} and t_{CPW} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if t_{WCS} t_{WCS} (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if t_{RWD} t_{RWD} (min), t_{CWD} t_{CWD} (min), and t_{AWD} t_{AWD} (min), or t_{CWD} t_{CWD} (min), t_{AWD} t_{AWD} (min) and t_{CPW} t_{CPW} (min), the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
- t_{DS} and t_{DH} are referred to \overline{UCAS} and \overline{LCAS} leading edge in early write cycles and to \overline{WE} leading edge in delayed write or read-modify-write cycles.

16. t_{RASP} defines \overline{RAS} pulse width in EDO page mode cycles.
17. Access time is determined by the longest among t_{AA} , t_{CAC} and t_{CPA} .
18. In delayed write or read-modify-write cycles, \overline{OE} must disable output buffer prior to applying data to the device.
19. When output buffers are enabled once, sustain the low impedance state until valid data is obtained. When output buffer is turned on and off within a very short time, generally it causes large V_{CC}/V_{SS} line noise, which causes to degrade $V_{IH\ min}/V_{IL\ max}$ level.
20. t_{HPC} (min) can be achieved during a series of EDO page mode write cycles or EDO page mode read cycles. If both write and read operation are mixed in a EDO page mode \overline{RAS} cycle (EDO page mode mix cycle (1), (2)), minimum value of \overline{CAS} cycle ($t_{CAS} + t_{CP} + 2 t_r$) becomes greater than the specified t_{HPC} (min) value. The value of \overline{CAS} cycle time of mixed EDO page mode is shown in EDO page mode mix cycle (1) and (2).
21. Data output turns off and becomes high impedance from later rising edge of \overline{RAS} and \overline{CAS} . Hold time and turn off time are specified by the timing specifications of later rising edge of \overline{RAS} and \overline{CAS} between t_{OHR} and t_{OH} , and between t_{OFR} and t_{OFF} .
22. t_{DOH} defines the time at which the output level go cross. $V_{OL} = 0.8\ V$, $V_{OH} = 2.0\ V$ of output timing reference level.
23. Before and after self refresh mode, execute CBR refresh to all refresh addresses in or within 64 ms period on the condition a and b below.
 - a. Enter self refresh mode within 15.6 μs after either burst refresh or distributed refresh at equal interval to all refresh addresses are completed.
 - b. Start burst refresh or distributed refresh at equal interval to all refresh addresses within 15.6 μs after exiting from self refresh mode.
24. In case of entering from \overline{RAS} -only-refresh, it is necessary to execute CBR refresh before and after self refresh mode according as note 23.
25. For L-version, it is available to apply each 128 ms and 31.2 μs instead of 64 ms and 15.6 μs at note 23.
26. At $t_{RASS} > 100\ \mu s$, self refresh mode is activated, and not activated at $t_{RASS} < 10\ \mu s$. It is undefined within the range of $10\ \mu s \leq t_{RASS} \leq 100\ \mu s$. For $t_{RASS} \leq 10\ \mu s$, it is necessary to satisfy t_{RPS} .
27. When both \overline{UCAS} and \overline{LCAS} go low at the same time, all 16-bit data are written into the device. \overline{UCAS} and \overline{LCAS} cannot be staggered within the same write/read cycles.
28. t_{ASC} , t_{CAH} , t_{RCS} , t_{WCS} , t_{WCH} , t_{CSR} and t_{RPC} are determined by the earlier falling edge of \overline{UCAS} or \overline{LCAS} .
29. t_{CRP} , t_{CHR} , t_{RCH} , t_{CPA} and t_{CPW} are determined by the later rising edge of \overline{UCAS} or \overline{LCAS} .
30. t_{CWL} , t_{DH} , t_{DS} and t_{CHS} should be satisfied by both \overline{UCAS} and \overline{LCAS} .
31. t_{CP} is determined by the time that both \overline{UCAS} and \overline{LCAS} are high.
32. XXX: H or L (H: $V_{IH\ (min)} \leq V_{IN} \leq V_{IH\ (max)}$, L: $V_{IL\ (min)} \leq V_{IN} \leq V_{IL\ (max)}$)
 //////////////: Invalid Dout
 When the address, clock and input pins are not described on timing waveforms, their pins must be applied V_{IH} or V_{IL} .

Notes concerning $\overline{2CAS}$ control

Please do not separate the $\overline{UCAS}/\overline{LCAS}$ operation timing intentionally. However skew between $\overline{UCAS}/\overline{LCAS}$ are allowed under the following conditions.

1. Each of the $\overline{UCAS}/\overline{LCAS}$ should satisfy the timing specifications individually.
2. Different operation mode for upper/lower byte is not allowed; such as following.

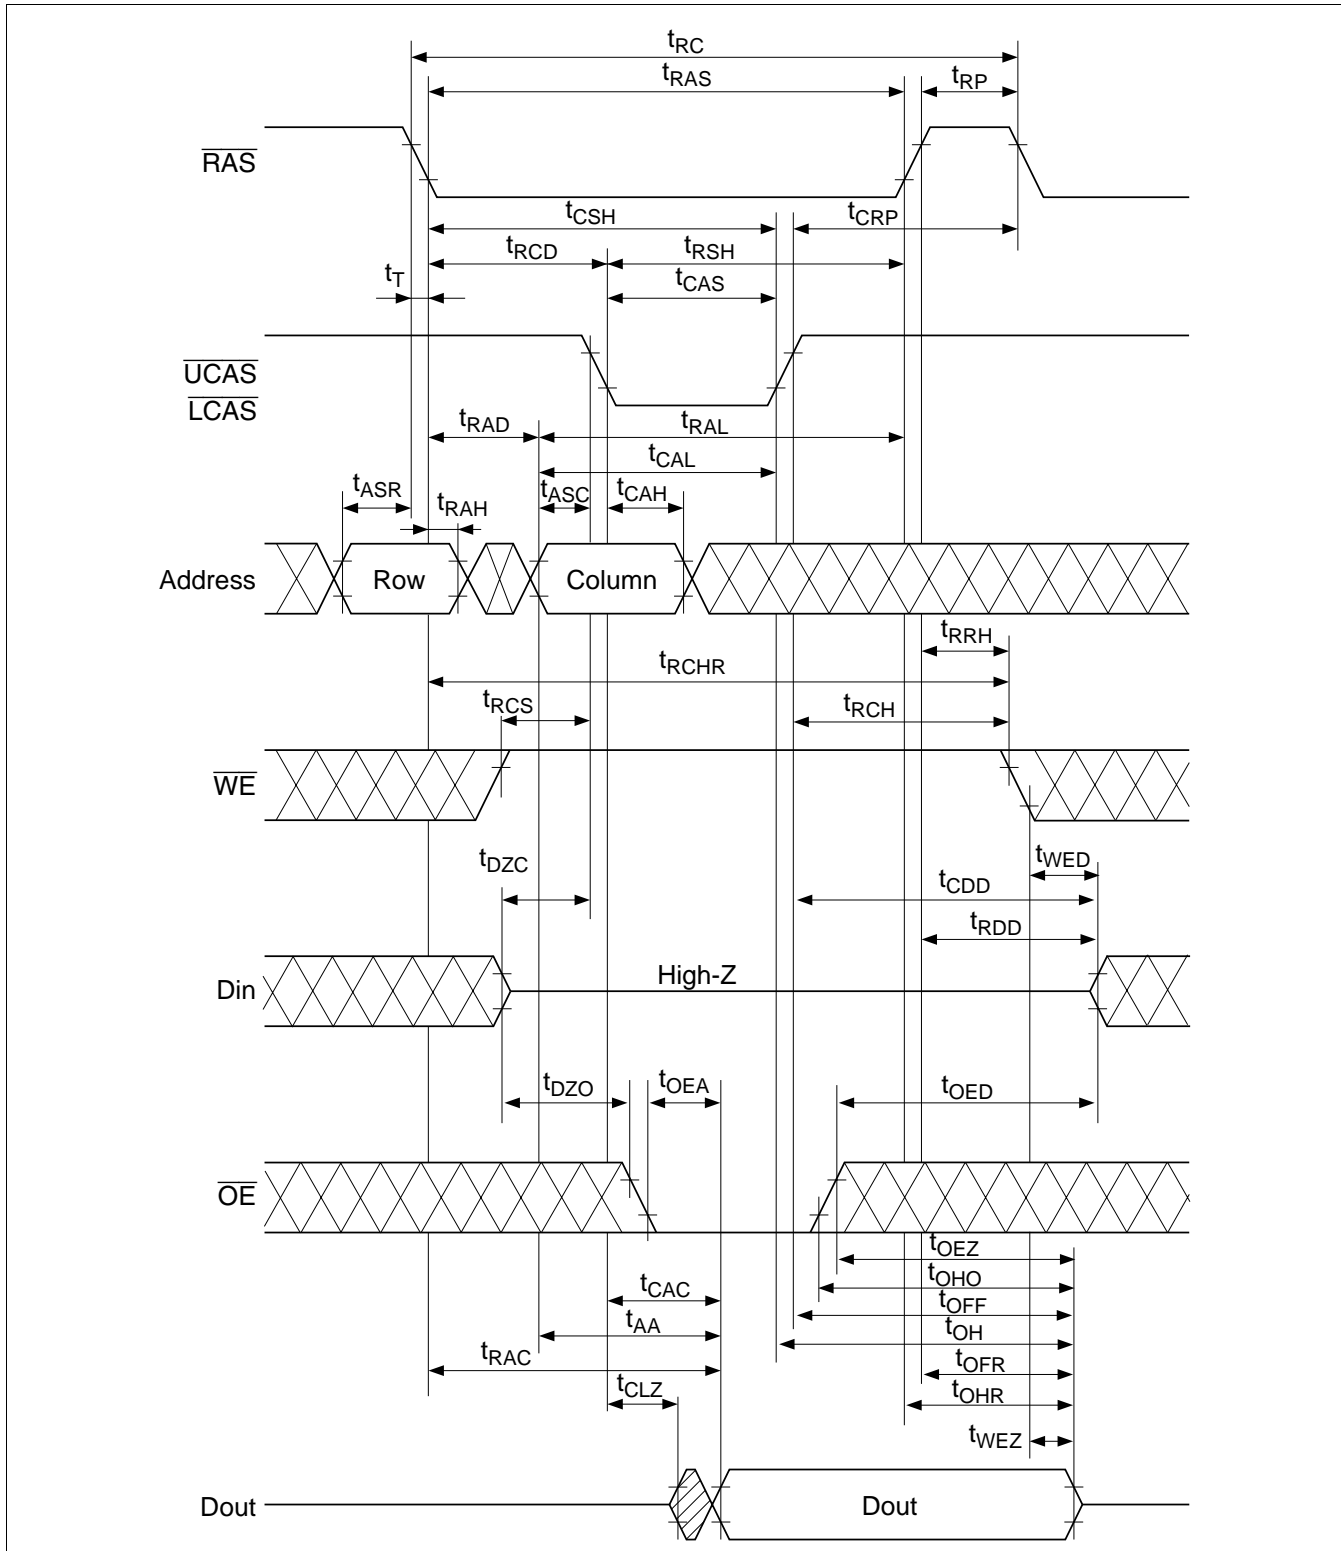

3. Closely separated upper/lower byte control is not allowed. However when the condition ($t_{CP} \leq t_{UL}$) is satisfied, EDO page mode can be performed.

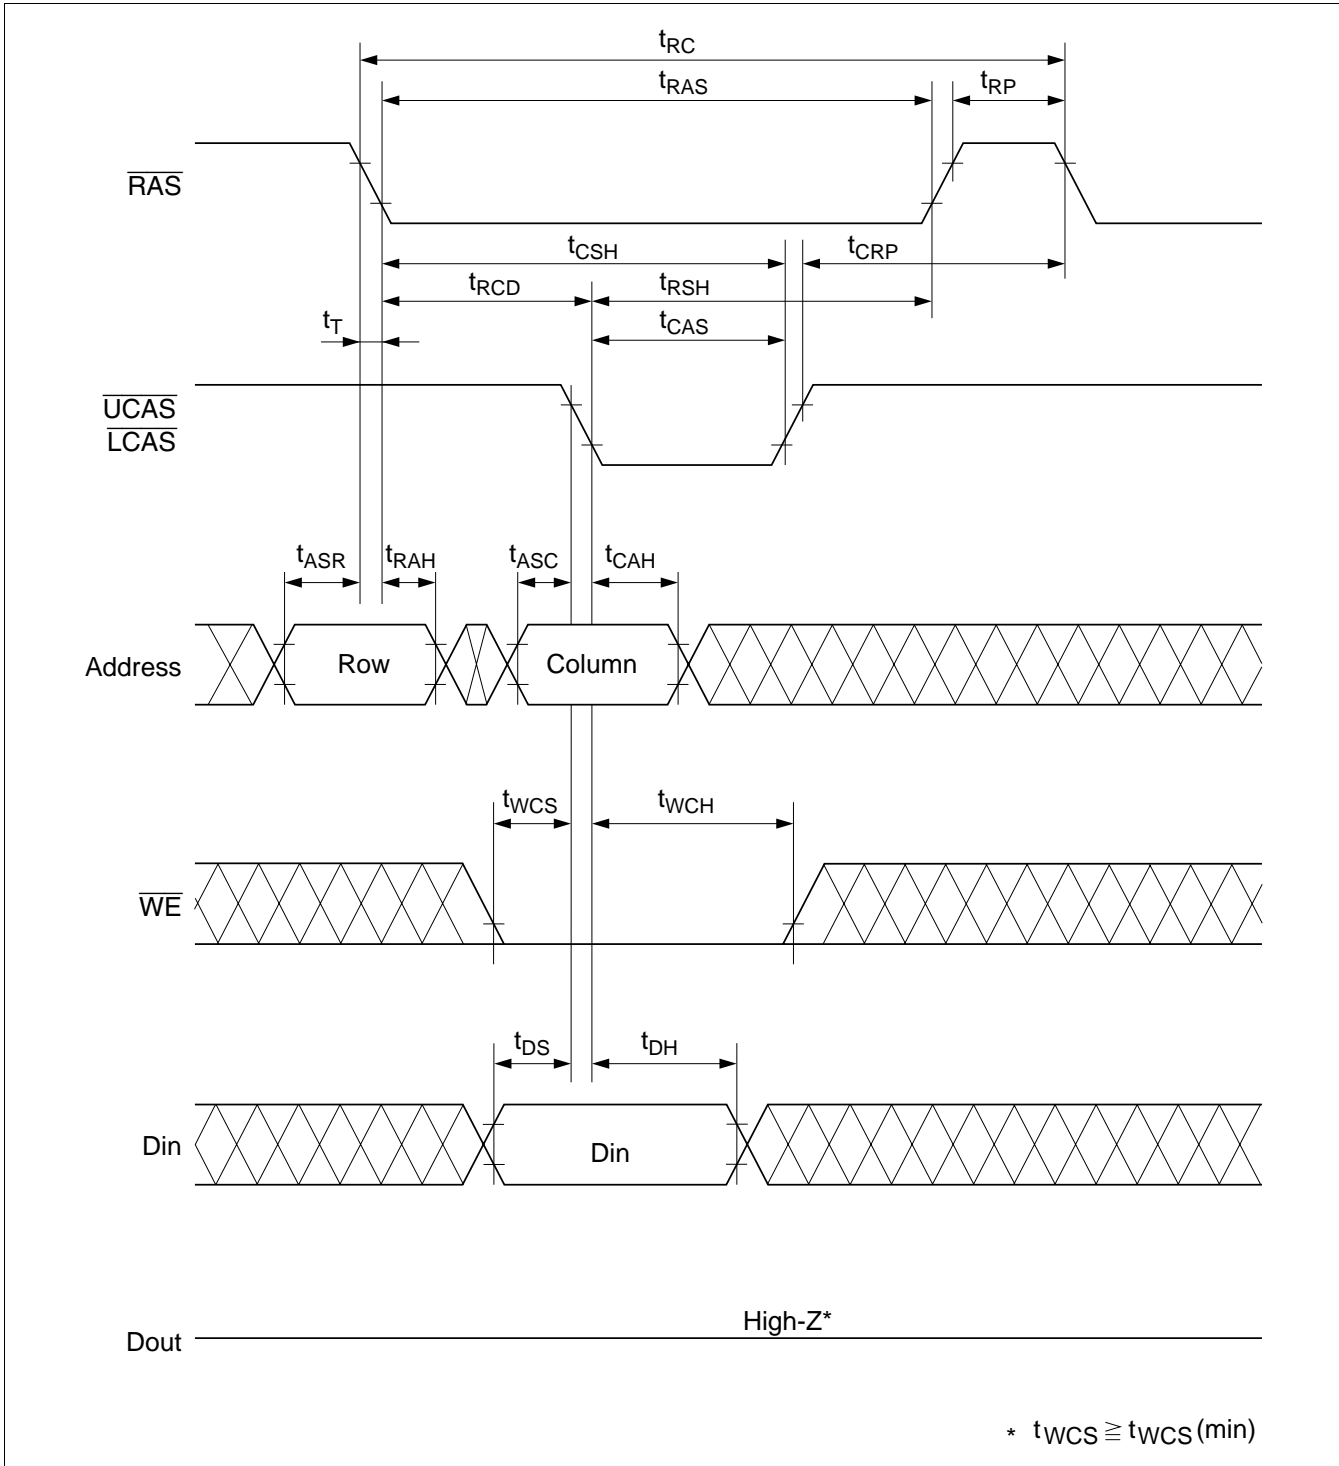

4. Byte control operation by remaining \overline{UCAS} or \overline{LCAS} high is guaranteed.
