

Description

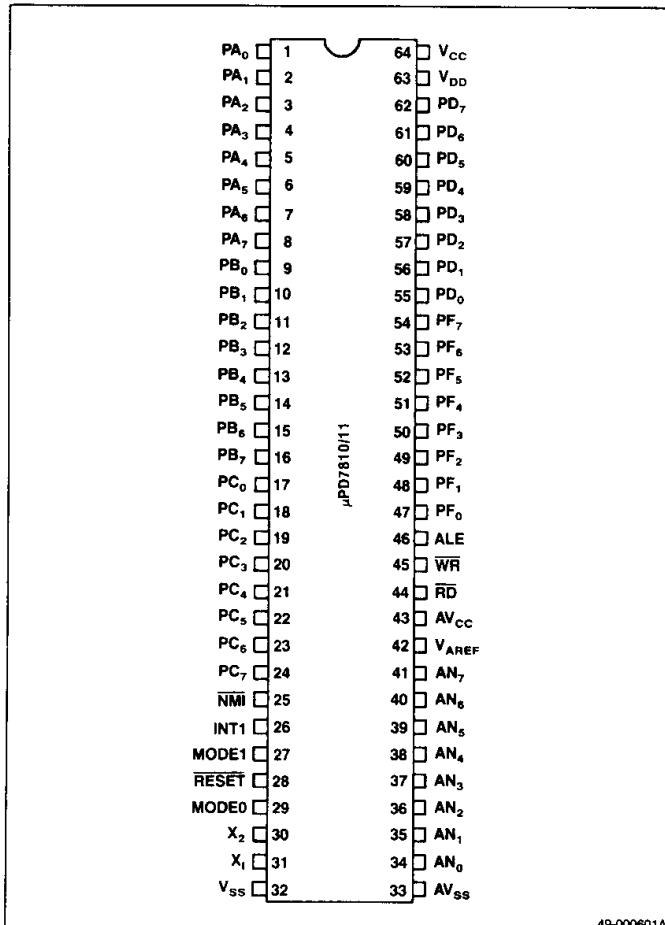

The μPD7810 and μPD7811 single-chip microcomputers integrate sophisticated on-chip peripheral functionality normally provided by external components. The device's internal 16-bit ALU and data paths, combined with a powerful instruction set and addressing, make the μPD7810/11 appropriate in data processing as well as control applications. The devices integrate a 16-bit ALU, 4K-ROM, 256-byte RAM with an 8-channel A/D converter, a multifunction 16-bit timer/event counter, two 8-bit timers, a USART, and two zero-cross detect inputs on a single die, allowing their use in fast, high end processing applications. This involves analog signal interface and processing.

The μPD7811 is the mask-ROM high volume production device embedded with custom customer program. The μPD7810 is a ROM-less version for prototyping and small volume production. The μPD78PG11E is a piggy-back EPROM version for design development.

Features

- NMOS silicon gate technology requiring +5 V power supply
- Complete single-chip microcomputer
 - 16-bit ALU
 - 4K x 8 ROM
 - 256-byte RAM
- 44 I/O lines
- Two zero-cross detect inputs
- Two 8-bit timers
- Expansion capabilities
 - 8085A bus-compatible
 - 60K-byte external memory address range
- 8-channel, 8-bit A/D converter
 - Autoscan mode
 - Channel select mode
- Full duplex USART
 - Synchronous and asynchronous
- 153 instructions
 - 16-bit arithmetic, multiply and divide
- 1 μs instruction cycle time (12 MHz operation)
- Prioritized interrupt structure
 - 3 external
 - 8 internal
- Standby function
- On-chip clock generator
- 64-pin plastic QUIC or shrink DIP

Pin Configuration

49-000601A

Ordering Information

Part Number	Package Type	Max Frequency of Operation
μPD7810G-36	64-pin plastic QUIC	12 MHz
μPD7811G-36		
μPD7810CW	64-pin plastic shrink DIP	12 MHz
μPD7811CW		

Pin Identification

No.	Symbol	Function
1-8	PA ₀ -PA ₇	Port A I/O
9-16	PB ₀ -PB ₇	Port B I/O
17	PC ₀ /TxD	Port C I/O line 0/Transmit data output
18	PC ₁ /RxD	Port C I/O line 1/Receive data input
19	PC ₂ /SCK	Port C I/O line 2/Serial clock I/O
20	PC ₃ /TI/ INT2	Port C I/O line 3/Timer input/Interrupt request 2 input
21	PC ₄ /TO	Port C I/O line 4/Timer output
22	PC ₅ /CI	Port C I/O line 5/Counter input
23, 24	PC ₆ , PC ₇ / CO ₀ , CO ₁	Port C I/O lines 6, 7/Counter outputs 0, 1
25	NMI	Nonmaskable interrupt input
26	INT1	Interrupt request 1 input
27	MODE1/M1	Mode 1 input/Memory cycle 1 output
28	RESET	Reset input
29	MODE0/ IO/M	Mode 0 input/I/O/Memory output
30, 31	X ₂ , X ₁	Crystal connections 1, 2
32	V _{SS}	Ground
33	AV _{SS}	Port T threshold voltage input
34-41	AN ₀ -AN ₇	A/D converter analog inputs 0-7
42	V _{AREF}	A/D converter reference voltage
43	AV _{CC}	A/D converter power supply
44	RD	Read strobe output
45	WR	Write strobe output
46	ALE	Address latch enable output
47-54	PF ₀ -PF ₇	Port F I/O/Expansion memory address bus (bits 8-15)
55-62	PD ₀ -PD ₇	Port D I/O/Expansion memory address/data bus
63	V _{DD}	RAM backup power supply
64	V _{CC}	5 V power supply

Pin Functions**PA₀-PA₇ [Port A]**

Port A is an 8-bit three-state port. Each bit is independently programmable as either input or output. Reset makes all lines of port A inputs.

PB₀-PB₇ [Port B]

Port B is an 8-bit three-state port. Each bit is independently programmable as either input or output. Reset makes all lines of port B inputs.

PC₀-PC₇ [Port C]

Port C is an 8-bit three-state port. Each bit is independently programmable as either input or output. Alternatively, the lines of port C can be used as control lines for the USART and timer. Reset puts all lines of port C in port mode, input.

TxD [Transmit Data]. Serial data output terminal.

RxD [Receive Data]. Serial data input terminal.

SCK [Serial Clock]. Output for the serial clock when internal clock is used. Input for serial clock when external clock is used.

TI [Timer Input]. Timer input terminal.

INT2 [Interrupt Request 2]. Falling-edge-triggered, maskable interrupt input terminal and AC-input, zero-cross detection terminal.

TO [Timer Output]. The output of TO is a square wave with a frequency determined by the timer/counter.

CI [Counter Input]. External pulse input to timer/event counter.

CO₀, CO₁ [Counter Outputs 0, 1]. Programmable rectangular wave outputs based on timer/event counter.

PD₀-PD₇ [Port D]

Port D is an 8-bit three-state port. It can be programmed as either 8 bits of input or 8 bits of output. When external expansion memory is used, port D acts as the multiplexed address/data bus.

PF₀-PF₇ [Port F]

Port F is an 8-bit three-state port. Each bit is independently programmable as an input or output. When external expansion memory is used, port F outputs the high-order address bits.

AN₀-AN₇

These are the eight analog inputs to the A/D converter. AN₄-AN₇ can also be used as a digital input for falling edge detection.

AV_{SS} [A/D Converter Power Ground]

AV_{SS} is the ground potential for the A/D converter power supply.

NMI [Nonmaskable Interrupt]

Falling-edge-triggered nonmaskable interrupt input.

INT1 [Interrupt Request 1]

INT1 is a rising-edge-triggered, maskable interrupt input. It is also an AC-input, zero-cross detection terminal.

RESET [Reset]

When the RESET input is brought low, it initializes the μ PD7810/11.

MODE1, MODE0 [Mode 1, 0]

The MODE1 and MODE0 inputs select the memory expansion mode. MODE1 also outputs the M1 signal during each opcode fetch. MODE0 outputs the I_O/M signal.

V_{AREF} [A/D Converter Reference]

V_{AREF} set the upper limit for the A/D converter's conversion range.

AV_{CC} [A/D Converter Power]

This is the power supply voltage for the A/D converter.

R_D [Read Strobe]

The R_D output goes low to gate data from external devices onto the data bus. R_D goes high during reset.

WR [Write Strobe]

The WR output goes low to indicate that the data bus holds valid data. It is a strobe signal for external memory or I/O write operations. WR goes high during reset.

ALE [Address Latch Enable]

The ALE output latches the address signal to the output of PD₀-PD₇.

X1, X2 [Crystal Connections 1, 2]

X1 and X2 are the system clock crystal oscillator terminals. X1 is the input for an external clock.

V_{SS} [Ground]

Ground potential.

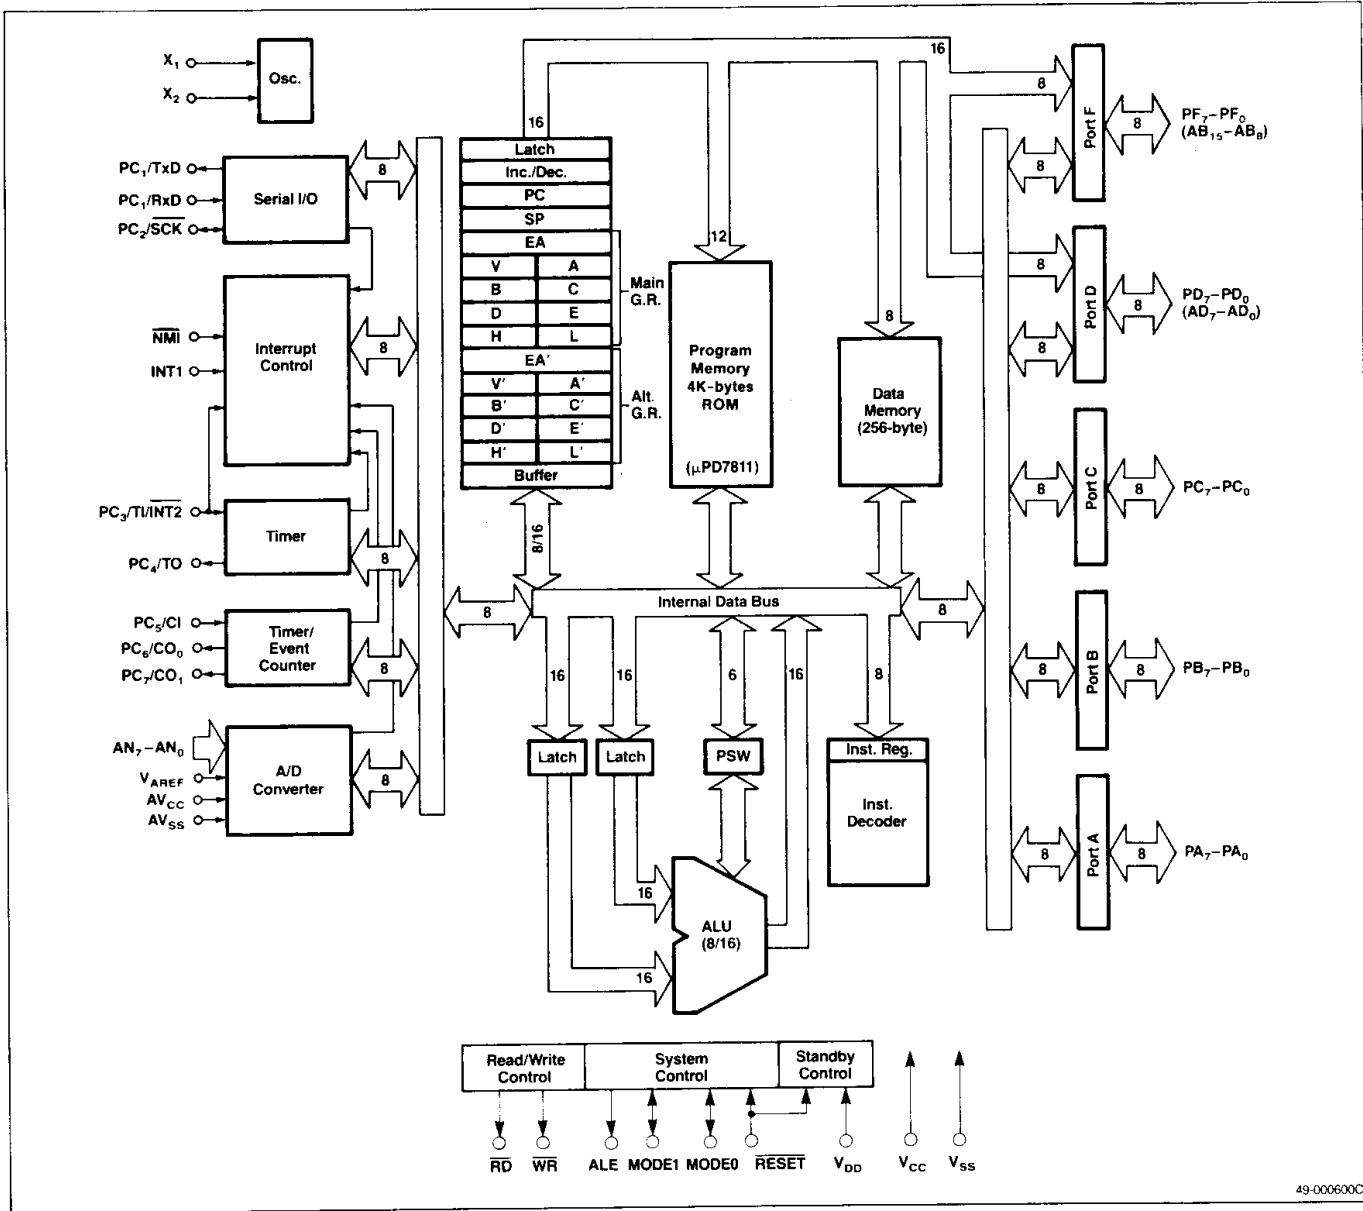

V_{DD} [Backup Power]

Backup power for on-chip RAM.

V_{CC} [Power Supply]

+5 V power supply.

Block Diagram

49-000600C

Functional Description

Memory Map

The μ PD7811 can directly address up to 64K bytes of memory. Except for the on-chip ROM (0-4095) and RAM (65280-65535), any memory location can be used as ROM or RAM. The memory map, figure 1, defines the 0 to 64K byte memory space for the μ PD7811.

Input/Output

The μ PD7810/11 has 8 analog input lines (AN₀-AN₇), 44 digital I/O lines, five 8-bit ports (port A, port B, port C, port D, port F), and 4 input lines (AN₄-AN₇).

Analog Input Lines. AN₀-AN₇ are configured as analog input lines for on-chip A/D converter.

Port A, Port B, Port C, Port F. Each line of these ports can be individually programmed as an input or output. When used as I/O ports, all have latched outputs and high-impedance inputs.

Port D. Port D can be programmed as a byte input or a byte output.

AN₄-AN₇. The high order analog input lines, AN₄-AN₇, can be used as digital input lines for falling edge detection.

Control Lines. Under software control, each line of port C can be configured individually to provide control lines for the serial interface, timer, and timer/counter.

Memory Expansion. In addition to the single-chip operation mode, the μ PD7811 has four memory expansion modes. Under software control, port D can provide a multiplexed low-order address and data bus; port F can provide a high-order address bus. Table 1 shows the relation between memory expansion modes and the pin configurations of port D and port F.

Table 1. Memory Expansion Modes and Port Configurations

Memory Expansion	Port Configuration	
None	Port D	I/O port
	Port F	I/O port
256 Bytes	Port D	Multiplexed address/data bus
	Port F	I/O port
4K Bytes	Port D	Multiplexed address/data bus
	Port F ₀ -F ₃	Address bus
	Port F ₄ -F ₇	I/O port
16K Bytes	Port D	Multiplexed address/data bus
	Port F ₀ -F ₅	Address bus
	Port F ₆ -F ₇	I/O port
60K Bytes	Port D	Multiplexed address/data bus
	Port F	Address bus

Timers

There are two 8-bit timers. The timers may be programmed independently or may be cascaded and used as an 8-bit timer with 8-bit prescaler. The timer can be software set to increment at intervals of four machine cycles (1 μ s at 12 MHz operation) or 128 machine cycles (32 μ s at 12 MHz), or to increment on receipt of a pulse at TI. Figure 2 shows the block diagram for the timer.

Timer/Event Counter

The 16-bit multifunctional timer/event counter (figure 3) can be used for the following operations:

- Interval timer
- External event counter
- Frequency measurement
- Pulse width measurement
- Programmable square-wave output

Figure 1. Memory Map

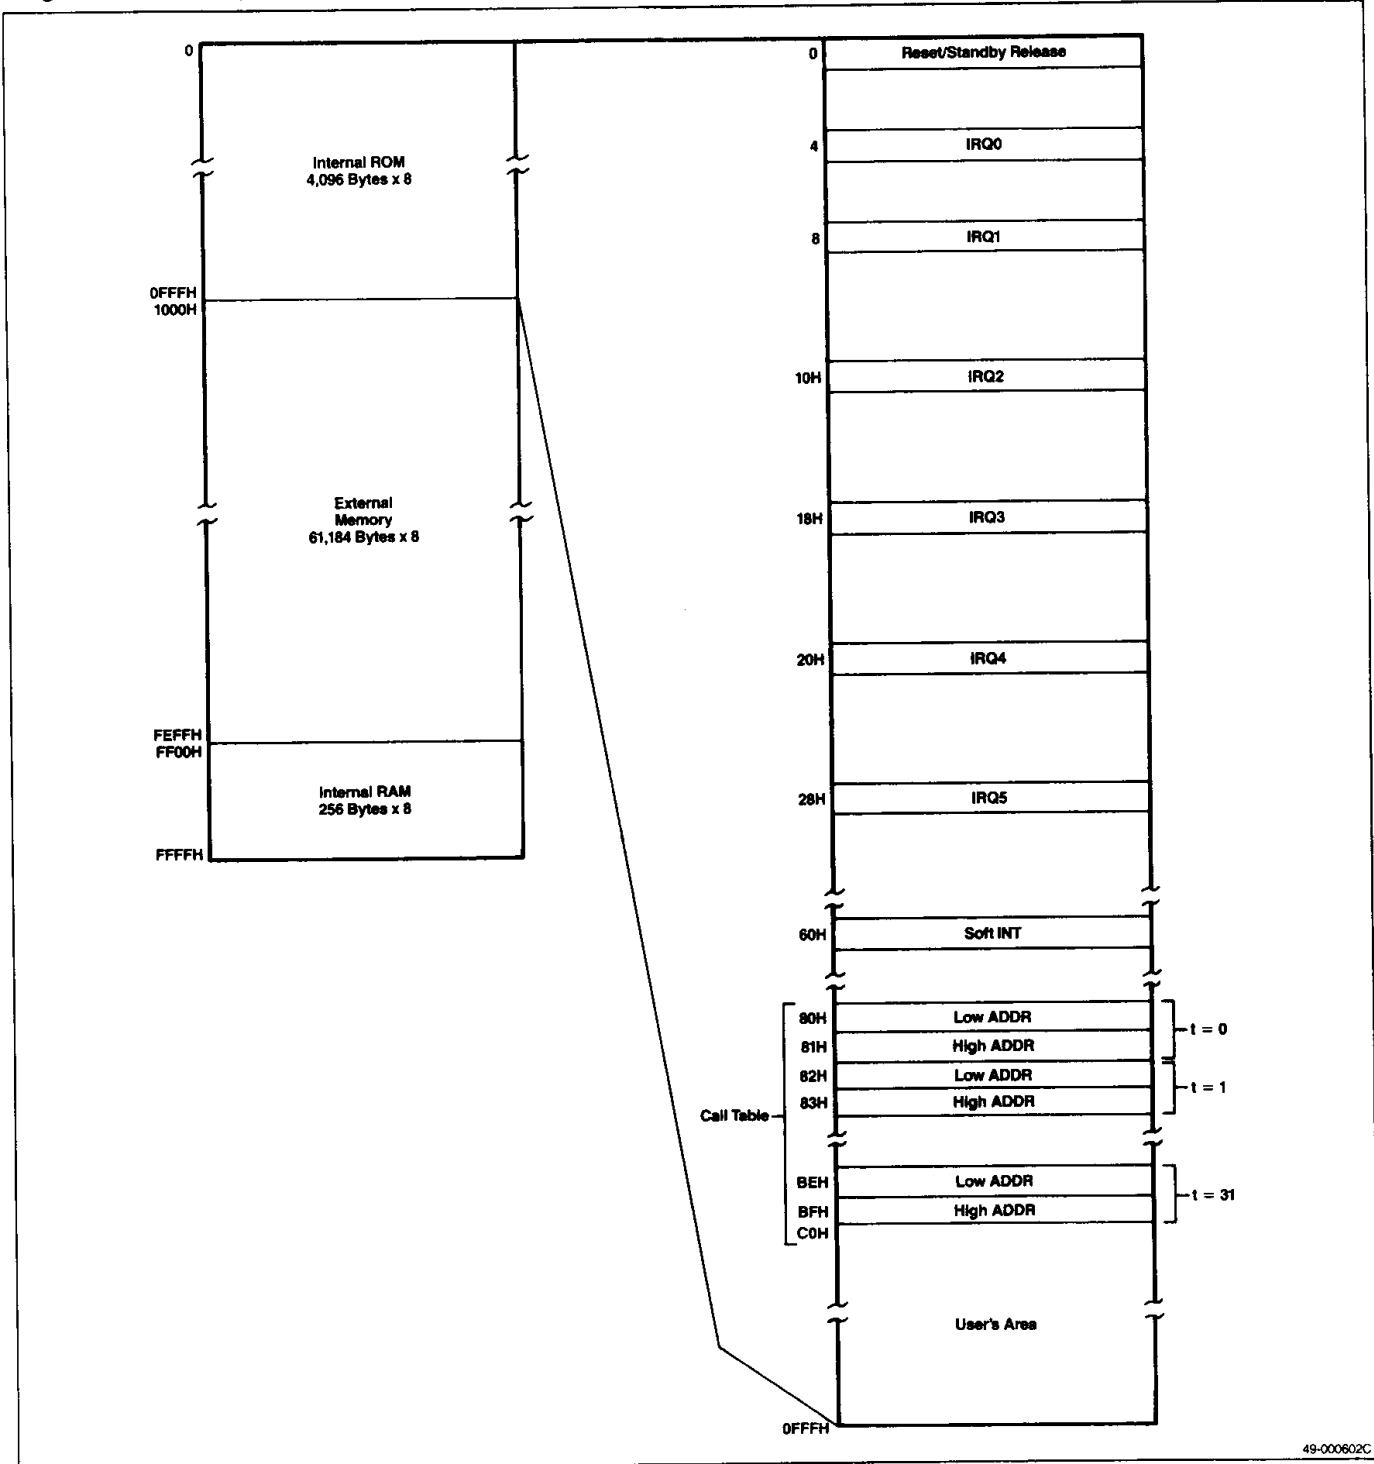

Figure 2. Timer Block Diagram

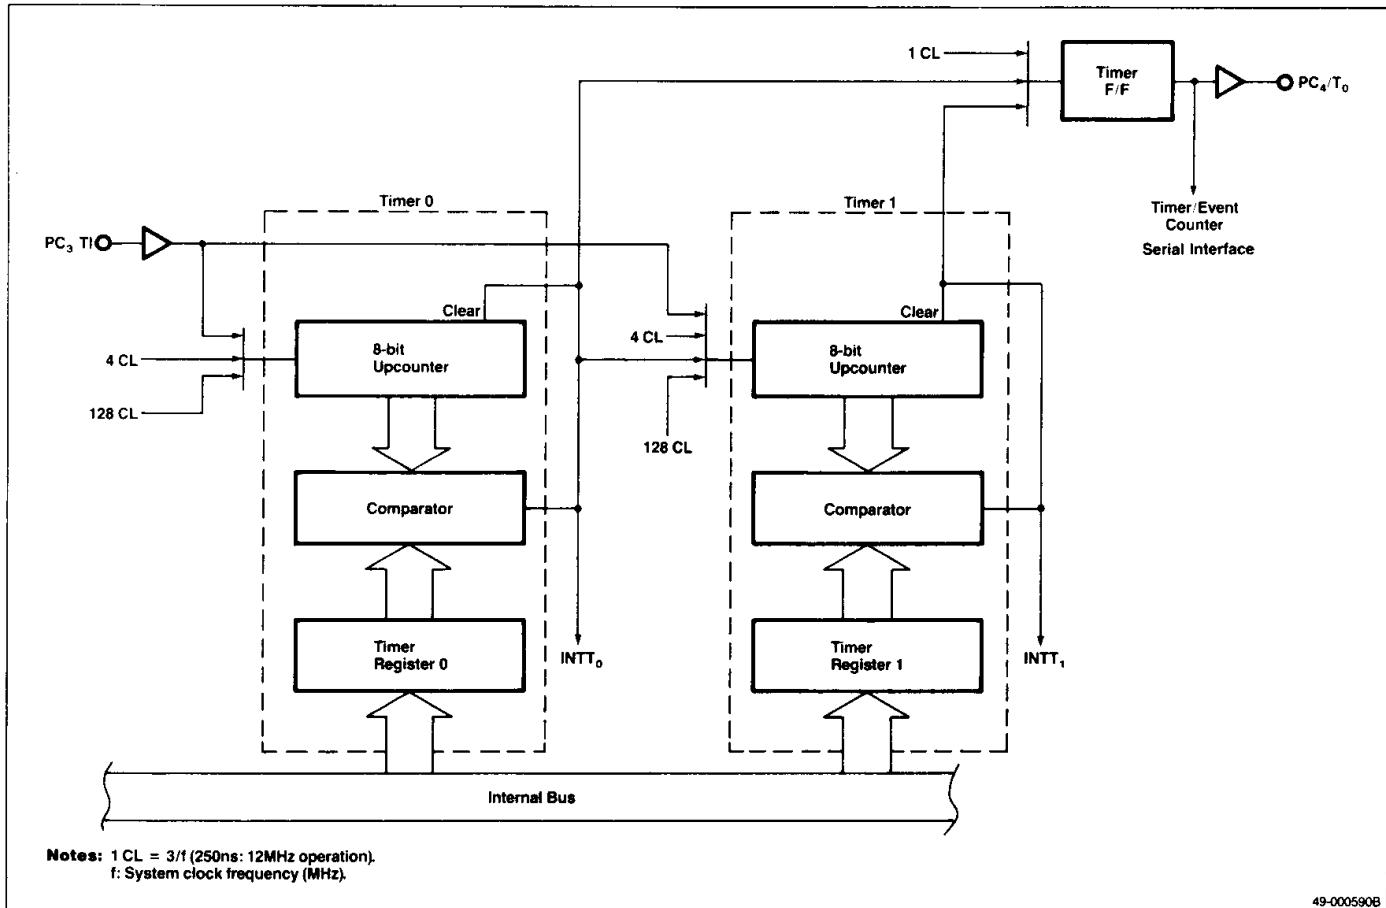

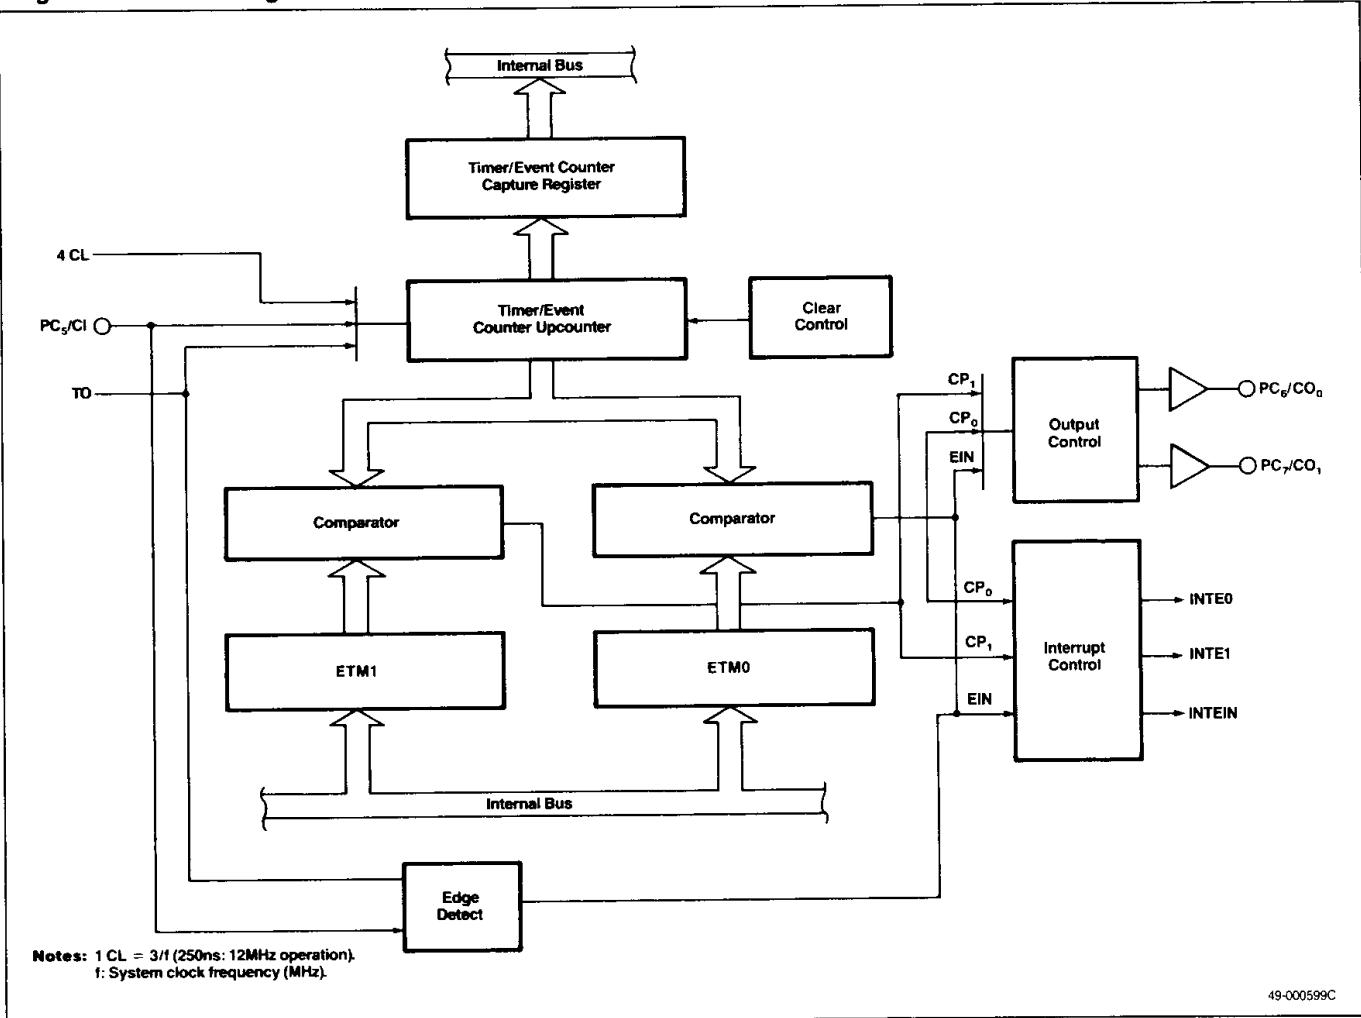

Figure 3. Block Diagram for Timer/Event Counter

8-Bit A/D Converter

- 8 input channels
- 4 conversion result registers
- 2 powerful operation modes
 - Autoscan mode
 - Channel select mode
- Successive approximation technique
- Absolute accuracy: ± 1.5 LSB ($\pm 0.6\%$)
- Conversion range: 0 to 5 V
- Conversion time: 48 μ s
- Interrupt generation

Analog/Digital Converter

The μ PD7810/11 features an 8-bit, high speed, high accuracy A/D converter. The A/D converter is made up of a 256-resistor ladder and a successive approximation register (SAR). There are four conversion result registers (CR_0 - CR_3). The 8-channel analog input may be operated in either of two modes. In the select mode, the conversion value of one analog input is sequentially stored in CR_0 - CR_3 . In the scan mode, the upper four channels or the lower four channels may be specified. Then those four channels will be consecutively selected and the conversion results stored sequentially in the four conversion result registers. Figure 4 shows the block diagram for the A/D converter.

Interrupt Structure

There are 11 interrupt sources. Three are external interrupts and eight are internal. The following table 2, shows 11 interrupt sources divided into six priority levels. See figure 5.

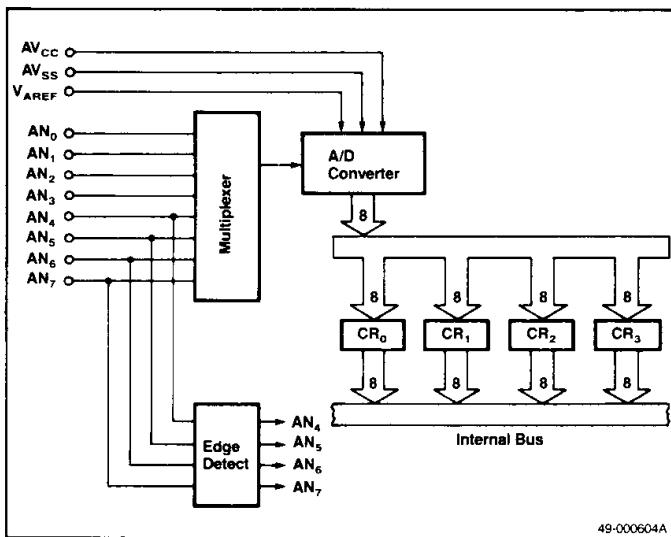

Standby Function

The standby function saves the top 32 bytes of RAM with backup power (V_{DD}) if the main power (V_{CC}) fails. On power-up, you can check the standby flag (SB) to determine whether recovery was made from standby mode or from a cold start.

Table 2. Interrupt Sources

Interrupt Request	Interrupt Address	Type of Interrupt	Internal/External
IRQ0	4	NMI (Nonmaskable interrupt)	Ext
IRQ1	8	INTT0 (Coincidence signal from timer 0)	Int
		INTT1 (Coincidence signal from timer 1)	
IRQ2	16	INT1 (Maskable interrupt)	Ext
		INT2 (Maskable interrupt)	
IRQ3	24	INTE0 (Coincidence signal from timer/event counter)	Int
		INTE1 (Coincidence signal from timer/event counter)	
IRQ4	32	INTEIN (Falling signal of CI and T0 counter)	Int/Ext
		INTAD (A/D converter interrupt)	
IRQ5	40	INTSR (Serial receive interrupt)	Int
		INST (Serial send interrupt)	

Figure 4. A/D Converter Block Diagram

Universal Serial Interface

The serial interface can operate in one of three modes: synchronous, asynchronous, and I/O interface. The I/O interface mode transfers data MSB first, for easy interfacing to certain NEC peripheral devices. Synchronous and asynchronous modes transfer data LSB first. Synchronous operation offers two modes of data reception: search and nonsearch. In the search mode, data is transferred one bit at a time from the serial register to the receive buffer. This allows a software search for a sync character. In the nonsearch mode, data transfer from the serial register to the transmit buffer occurs eight bits at a time. Figure 6 shows the universal serial interface block diagram.

Figure 5. Interrupt Structure Block Diagram

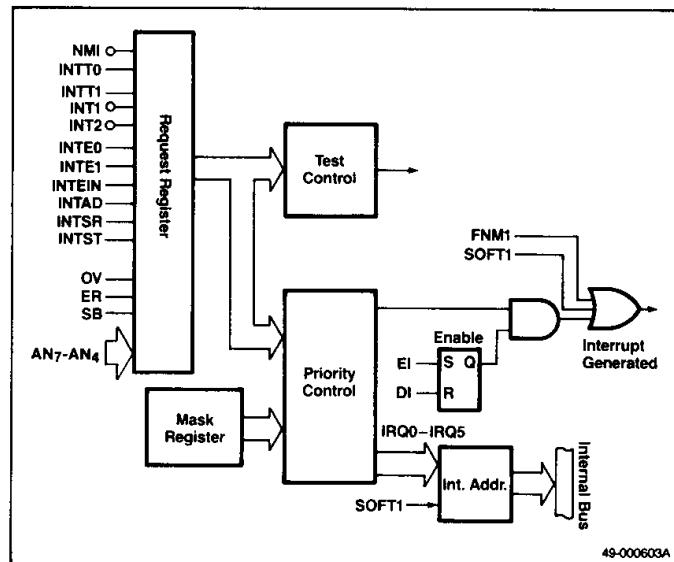

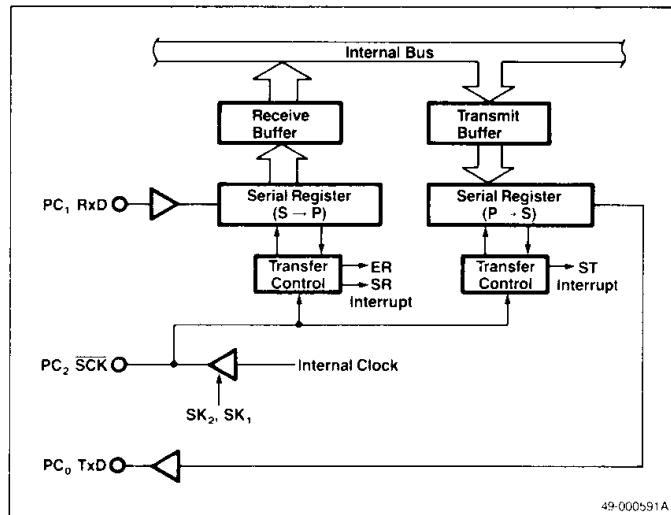

Figure 6. Universal Signal Interface Block Diagram

Zero-Crossing Detector

The INT1 and INT2 terminals (used common to TI and PC₃) can detect the zero-crossing point of low-frequency AC signals. When driven directly, these pins respond as a normal digital input. Figure 7 shows the zero-crossing detection circuitry.

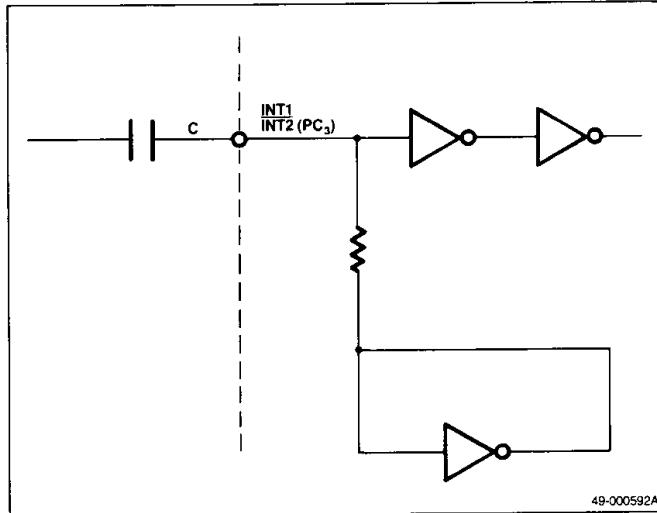

The zero-crossing detection capability allows you to make the 50-60 Hz power signal the basis for system timing and to control voltage phase-sensitive devices.

To use the zero-cross detection mode, an AC signal of approximately 1-3 V AC (peak-to-peak) and a maximum frequency of 1 kHz is coupled through an external capacitor to the INT1 and INT2 pins.

For the INT1 pin, the internal digital state is sensed as a 0 until the rising edge crosses the average DC level, when it becomes a 1 and INT1 interrupt is generated.

For the INT2 pin, the state is sensed as a 1 until the falling edge crosses the average DC level, when it becomes a 0 and INT2 interrupt is generated.

Figure 7. Zero-Crossing Detection Circuit

Absolute Maximum Ratings

Power supply voltages, V _{CC}	-0.5 V to +7.0 V
V _{DD}	-0.5 V to +7.0 V
A _{VCC}	-0.5 V to +7.0 V
A _{VSS}	-0.5 V to +0.5 V
Input voltage, V _I	-0.5 V to +7.0 V
Output voltage, V _O	-0.5 V to +7.0 V
Reference input voltage, V _{AREF}	-0.5 V to V _{CC}
Operating temperature, T _{OPR}	-10°C to +70°C
10 MHz $\leq f_{XTAL} \leq$ 12 MHz	
f _{XTAL} \leq 10 MHz	-40°C to -85°C
Storage temperature, T _{STG}	-65°C to +150°C

Comment: Exposing the device to stresses above those listed in absolute maximum ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of this specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Operating Conditions

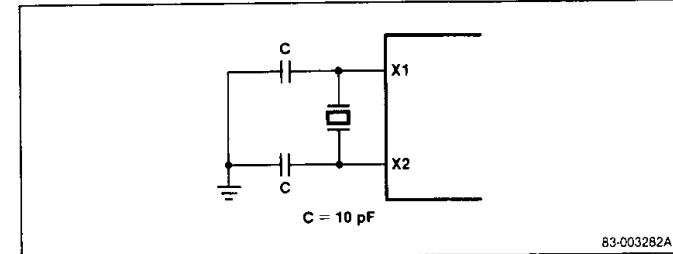

Oscillating Frequency	T _A	V _{CC} , A _{VCC}
f _{XTAL} \leq 10 MHz	-40°C to +85°C	+5.0 V \pm 10%
10 MHz $\leq f_{XTAL} \leq$ 12 MHz	-10°C to +70°C	+5.0 V \pm 5%

Capacitance

T_A = 25°C; V_{CC} = V_{DD} = V_{SS} = 0 V

Parameter	Symbol	Limits			Test Conditions
		Min	Typ	Max	
Capacitance	C _I			10	pF A _{f_C} = 1 MHz.
Output capacitance	C _O			20	pF Unmeasured pins returned to 0 V.
I/O capacitance	C _{I/O}			20	pF

Recommended XTAL Oscillation Circuit

DC Characteristics

$T_A = -10^\circ\text{C}$ to $+70^\circ\text{C}$; $V_{CC} = +5.0 \text{ V} \pm 5\%$; $V_{SS} = 0 \text{ V}$; $V_{DD} = V_{CC} - 0.8 \text{ V}$ to V_{CC}

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
Input low voltage	V_{IL}	0		0.8	V	
Input high voltage	V_{IH1}	2.0		V_{CC}	V	All except $\overline{\text{SCK}}$, RESET, X1 and X2
	V_{IH2}	0.8 V_{CC}		V_{CC}	V	$\overline{\text{SCK}}, \text{X1}, \text{X2}$
	V_{IH3}	0.8 V_{DD}		V_{CC}	V	RESET
Output low voltage	V_{OL}			0.45	V	$I_{OL} = 2.0 \text{ mA}$
Output high voltage	V_{OH}	2.4		V		$I_{OH} = -200 \mu\text{A}$
Data retention voltage	V_{DDDR}	3.2		V		$V_{CC} = 0 \text{ V}$; RESET = V_{IL}
Input current	I_I		± 200	μA		INT1, TI(PC_3); + $0.45 \text{ V} \leq V_I < V_{CC}$
Input leakage current	I_{LI}		± 10	μA		All except INT, TI(PC_3) $0 \text{ V} \leq V_I \leq V_{CC}$
Output leakage current	I_{LO}		± 10	μA		$+0.45 \text{ V} \leq V_O \leq V_{CC}$
$A_{V_{CC}}$ supply current	$A_{I_{CC}}$	6	12	mA		
V_{DD} supply current	I_{DD}	1.5	3.5	mA		$T_A = -40$ to $+85^\circ\text{C}$
			3.2	mA		$V_{CC} = V_{DD} = 5 \text{ V}$ $T_A = -10$ to $+70^\circ\text{C}$
V_{CC} supply current	I_{CC}	150	220	mA		$T_A = -40$ to $+85^\circ\text{C}$; $V_{CC} = V_{DD} = 5 \text{ V}$

Serial Operation

Parameter	Symbol	Limits			Test Conditions
		Min	Max	Unit

Notes:

- (1) In the case of skip condition, the idle states are as follows:
 - 1-byte instruction: 4 states
 - 2-byte instruction (with *): 7 states
 - 3-byte instruction (with *): 10 states
 - 4-byte instruction: 11 states
- (2) B2 (Data): rpa2 = D + byte, H + byte.
- (3) Right side of slash (/) in states indicates case rpa2, rpa3 = D + byte, H + A, H + B, H + EA, H + byte.
- (4) B3 (Data): rpa3 = D + byte, H + byte
