Proper cares in using IC

1. VCO stop method
   Short pin 7 and pin 3 (V_{CC} pin) to stop the VCO.
   (Note) The maximum voltage to be applied to pin 7 must not exceed the voltage on pin 3.
2. Free-running frequency check method : Use either of the following two methods.
   a) Connect pin 4 to a frequency counter through the high input impedance amplifier.

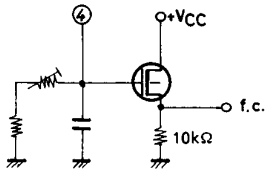

Figure 1

b) Connect the connection point of the semifixed resistor connected to pin 4 and the fixed resistor to a frequency counter through the R_X of 240 kΩ. Fig. 2 shows how the error changes as the R_X value is decreased.

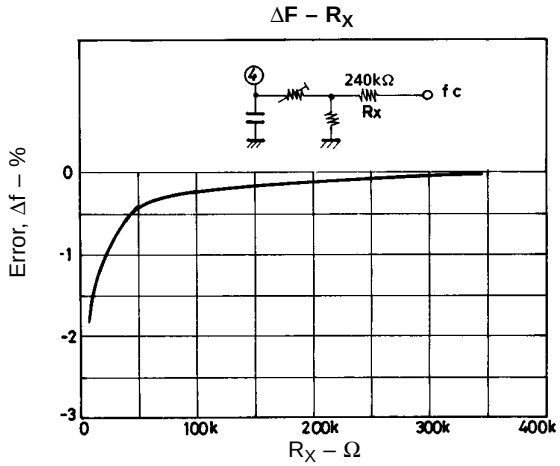

Figure 2

3. Separation setting mothod

The LA3335M is so designed that the sub-signal gain is approximately 1.25 times as high as the main signal gain. The separation can be set by attenuating the sub-signal of the FM detection output. (See Figure 3)

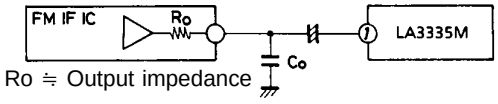

Figure 3

The value of capacitor Co depends on the attenuation of the sub-signal of the FM detection output and the IF IC output impedance Ro. Fig. 4 shows the value of separation setting capacitor Co when Ro is set to 3 kΩ.
For example, when the attenuation of sub-signal of the IF IC output is 0.9 time that of the main signal, it is seen from Figure 4 that the value of Co is approximately 500 pF.
