

## 80960CF-40, -33, -25, -16

# 32-BIT HIGH-PERFORMANCE SUPERSCALAR EMBEDDED MICROPROCESSOR

- *Socket and Object Code Compatible with 80960CA*
  - *Two Instructions/Clock Sustained Execution*
- *Four 71 Mbytes/s DMA Channels with Data Chaining*
  - *Demultiplexed 32-Bit Burst Bus with Pipelining*

- **32-Bit Parallel Architecture**
    - Two Instructions/clock Execution
    - Load/Store Architecture
    - Sixteen 32-Bit Global Registers
    - Sixteen 32-Bit Local Registers
    - Manipulates 64-Bit Bit Fields
    - 11 Addressing Modes
    - Full Parallel Fault Model
    - Supervisor Protection Model
  - **Fast Procedure Call/Return Model**
    - Full Procedure Call in 4 Clocks
  - **On-Chip Register Cache**
    - Caches Registers on Call/Ret
    - Minimum of 6 Frames Provided
    - Up to 15 Programmable Frames
  - **On-Chip Instruction Cache**
    - 4 Kbyte Two-Way Set Associative
    - 128-Bit Path to Instruction Sequencer
    - Cache-Lock Modes
    - Cache-Off Mode
  - **High Bandwidth On-Chip Data RAM**
    - 1 Kbyte On-Chip Data RAM
    - Sustains 128 bits per Clock Access
  - **Selectable Big or Little Endian Byte Ordering**
  - **Four On-Chip DMA Channels**
    - 71 Mbytes/s Fly-by Transfers
    - 40 Mbytes/s Two-Cycle Transfers
    - Data Chaining
    - Data Packing/Unpacking
    - Programmable Priority Method
  - **32-Bit Demultiplexed Burst Bus**
    - 128-Bit Internal Data Paths to *and from* Registers
    - Burst Bus for DRAM Interfacing
    - Address Pipelining Option
    - Fully Programmable Wait States
    - Supports 8-, 16- or 32-Bit Bus Widths
    - Supports Unaligned Accesses
    - Supervisor Protection Pin
  - **High-Speed Interrupt Controller**
    - Up to 248 External Interrupts
    - 32 Fully Programmable Priorities
    - Multi-mode 8-Bit Interrupt Port
    - Four Internal DMA Interrupts
    - Separate, Non-maskable Interrupt Pin
    - Context Switch in 625 ns Typical
  - **On-Chip Data Cache**
    - 1 Kbyte Direct-Mapped, Write Through
    - 128 bits per Clock Access on Cache Hit
-

## 1.0 PURPOSE

This document provides electrical characteristics of Intel's i960<sup>®</sup> CF embedded microprocessor. For functional descriptions consult the *i960<sup>®</sup> Cx Microprocessor User's Manual (270710)*. To obtain data sheet updates and errata, contact Intel at any of the following numbers.

## 2.0 80960CF OVERVIEW

Intel's 80960CF is the second processor in the series of superscalar i960 microprocessors that also includes the 80960CA and the 80960HA/HD/HT. Upgrading from the 80960CA to the 80960CF is straightforward because the two processors are socket- and object code-compatible.

As shown in Figure 1, the 80960CF's instruction cache is 4 Kbytes; data cache is 1 Kbyte (80960CA instruction cache is 1 Kbyte; it does not have a data cache.) This extra cache on the CF adds a significant performance boost over the CA.

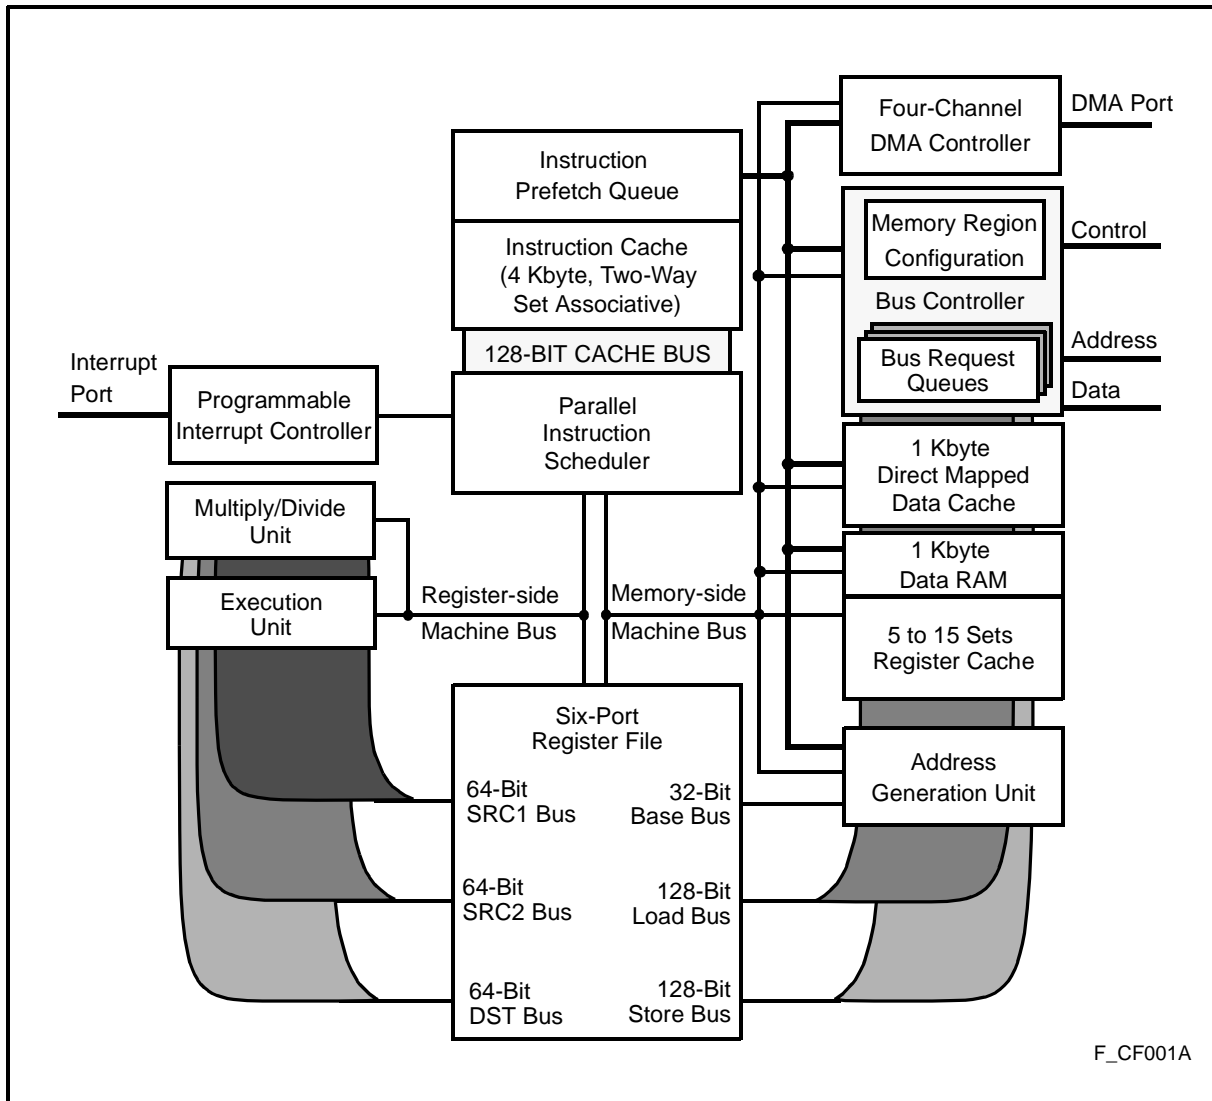

Figure 1. 80960CF Block Diagram

The 80960CF, object code compatible with the 32-bit 80960 core Architecture, employs Special Function Register extensions to control on-chip peripherals and instruction set extensions to shift 64-bit operands and configure on-chip hardware. Multiple 128-bit internal buses, on-chip instruction caching and a sophisticated instruction scheduler allow the processor to sustain execution of two instructions per clock with peak execution of three instructions per clock.

A 32-bit demultiplexed and pipelined burst bus provides a 132 Mbyte/s bandwidth to a system's

high-speed external memory subsystem. Also, the 80960CF's on-chip caching of instructions, procedure context and critical program data substantially decouples system performance from the wait states associated with accesses to the system's slower, cost sensitive, main memory subsystem.

The 80960CF bus controller integrates full wait state and bus width control for highest system performance with minimal system design complexity. Unaligned access and Big Endian byte order support reduces the cost of porting existing applications to the 80960CF.

The processor also integrates four complete data-chaining DMA channels and a high-speed interrupt controller on-chip. DMA channels perform single-cycle or two-cycle transfers, data packing and unpacking and data chaining. Block transfers — in addition to source or destination synchronized transfers — are supported.

The interrupt controller provides full programmability of 248 interrupt sources into 32 priority levels with a typical interrupt task switch (latency) time of 625 ns.

## 2.1 The 80960C-Series Core

The C-Series core is a very high performance microarchitectural implementation of the 80960 Core Architecture. This core can sustain execution of two instructions per clock (80 MIPS at 40 MHz). To achieve this level of performance, Intel has incorporated state-of-the-art silicon technology and innovative microarchitectural constructs into the C-Series core implementation. Factors that contribute to the core's performance include:

- Parallel instruction decoding allows issuance of up to three instructions per clock
- Single-clock execution of most instructions
- Parallel instruction decode allows sustained, simultaneous execution of two single-clock instructions every clock cycle
- Efficient instruction pipeline minimizes pipeline break losses
- Register and resource scoreboarding allow simultaneous multi-clock instruction execution
- Branch look-ahead and prediction allows many branches to execute with no pipeline break
- Local Register Cache integrated on-chip caches Call/Return context
- Two-way set associative, 4 Kbyte integrated instruction cache
- 1 Kbyte integrated Data RAM sustains a four-word (128-bit) access every clock cycle
- Direct mapped, 1 Kbyte data cache, write through, write allocate

## 2.2 Pipelined, Burst Bus

A 32-bit high performance bus controller interfaces the 80960CF to external memory and peripherals. The Bus Control Unit features a maximum transfer rate of 160 Mbytes per second (at 40 MHz). Internally programmable wait states and 16 separately configurable memory regions allow the processor to interface with a variety of memory subsystems with a minimum of system complexity and a maximum of performance. The Bus Control Unit's main features include:

- Demultiplexed, burst bus to exploit most efficient DRAM access modes
- Address pipelining to reduce memory cost while maintaining performance
- 32-, 16- and 8-bit modes for I/O interfacing ease
- Full internal wait state generation to reduce system cost
- Little and Big Endian support to ease application development
- Unaligned access support for code portability
- Three-deep request queue to decouple the bus from the core

## 2.3 Instruction Set Summary

Table 1 summarizes the 80960CF instruction set by logical groupings. See the *i960® Cx Microprocessor User's Manual (270710)* for a complete description of the instruction set.

## 2.4 Flexible DMA Controller

A four-channel DMA controller provides high speed DMA control for data transfers involving peripherals and memory. The DMA provides advanced features such as data chaining, byte assembly and disassembly and a high performance fly-by mode capable of transfer speeds of up to 71 Mbytes per second at 40 MHz. The DMA controller features a performance and flexibility which is only possible by integrating the DMA controller and the 80960CF core.

## 2.5 Priority Interrupt Controller

A programmable-priority interrupt controller manages up to 248 external sources through the 8-bit external interrupt port. The Interrupt Unit also handles the four internal sources from the DMA controller and a single non-maskable interrupt input. The 8-bit interrupt port can also be configured to provide individual interrupt sources that are level or edge triggered.

80960CF interrupts are prioritized and signaled within 225 ns of the request. If the interrupt is of higher priority than the processor priority, the context switch to the interrupt routine typically completes in another 400 ns. The interrupt unit provides the mechanism for the low latency and high throughput interrupt service which is essential for embedded applications.

**Table 1. 80960CF Instruction Set**

### 3.0 PACKAGE INFORMATION

#### 3.1 Package Introduction

This section describes the pins, pinouts and thermal characteristics for the 80960CF in the 168-pin Ceramic Pin Grid Array (PGA) package; the 80960CF-33, -25, -16 devices are also available in the 196-pin Plastic Quad Flat Package (PQFP). For complete package specifications and information, see the *Packaging Handbook* (# 240800).

#### 3.2 Pin Descriptions

This section defines the 80960CF pins. Table 2 presents the legend for interpreting the pin descriptions in the following tables. Pins associated with the 32-bit demultiplexed processor bus are described in Table 2. Pins associated with the 80960CF DMA Controller and Interrupt Unit are described in Table 3. Pins associated with basic processor configuration and control are described in Table 2.

All pins float while the processor is in the ONCE mode.

Symbol	Description
I	Input only pin
O	Output only pin
I/O	Pin can be either an input or output
–	Pins “must be” connected as described
S(...)	Synchronous. Inputs must meet setup and hold times relative to PCLK2:1 for proper operation. Outputs are synchronous to PCLK2:1. S(E) Edge sensitive input S(L) Level sensitive input
A(...)	Asynchronous. Inputs may be asynchronous to PCLK2:1. A(E) Edge sensitive input A(L) Level sensitive input
H(...)	While the bus is in the Hold Acknowledge or Bus Backoff state, the pin: H(1) is driven to $V_{CC}$ H(0) is driven to $V_{SS}$ H(Z) floats H(Q) continues to be a valid input
R(...)	While the processor’s $\overline{RESET}$ pin is low, the pin: R(1) is driven to $V_{CC}$ R(0) is driven to $V_{SS}$ R(Z) floats R(Q) continues to be a valid output

Table 2. 80960CF Pin Description — External Bus Signals (Sheet 1 of 3)

Name	Type	Description																																				
<b>A31:2</b>	<b>O</b> S H(Z) R(Z)	<b>ADDRESS BUS</b> carries the physical address' upper 30 bits. A31 is the most significant bit; A2 is least significant. During a bus access, A31:2 identify all external addresses to word (4-byte) boundaries. Byte enable signals indicate the selected byte in each word. During burst accesses, A3:2 increment to indicate successive data cycles.																																				
<b>D31:0</b>	<b>I/O</b> S(L) H(Z) R(Z)	<b>DATA BUS</b> carries 32-, 16- or 8-bit data quantities depending on bus width configuration. The least significant bit is carried on D0 and the most significant on D31. When the bus is configured for 8-bit data, the lower 8 data lines, D7:0 are used. For 16-bit data bus widths, D15:0 are used. For 32-bit bus widths the full data bus is used.																																				
<b>BE3:0</b>	<b>O</b> S H(Z) R(1)	<p><b>BYTE ENABLES</b> select which of the four bytes addressed by A31:2 are active during an access to a memory region configured for a 32-bit data-bus width. <math>\overline{BE3}</math> applies to D31:24; <math>\overline{BE2}</math> applies to D23:16; <math>\overline{BE1}</math> applies to D15:8 <math>\overline{BE0}</math> applies to D7:0.</p> <p>32-bit bus:</p> <table border="0"> <tr> <td><math>\overline{BE3}</math></td> <td>Byte Enable 3</td> <td>enable D31:24</td> </tr> <tr> <td><math>\overline{BE2}</math></td> <td>Byte Enable 2</td> <td>enable D23:16</td> </tr> <tr> <td><math>\overline{BE1}</math></td> <td>Byte Enable 1</td> <td>enable D15:8</td> </tr> <tr> <td><math>\overline{BE0}</math></td> <td>Byte Enable 0</td> <td>enable D7:0</td> </tr> </table> <p>For accesses to a memory region configured for a 16-bit data-bus width, the processor uses the <math>\overline{BE3}</math>, <math>\overline{BE1}</math> and <math>\overline{BE0}</math> pins as <math>\overline{BHE}</math>, A1 and <math>\overline{BLE}</math> respectively.</p> <p>16-bit bus:</p> <table border="0"> <tr> <td><math>\overline{BE3}</math></td> <td>Byte High Enable (<math>\overline{BHE}</math>)</td> <td>enable D15:8</td> </tr> <tr> <td><math>\overline{BE2}</math></td> <td>Not used (driven high or low)</td> <td></td> </tr> <tr> <td><math>\overline{BE1}</math></td> <td>Address Bit 1 (A1)</td> <td></td> </tr> <tr> <td><math>\overline{BE0}</math></td> <td>Byte Low Enable (<math>\overline{BLE}</math>)</td> <td>enable D7:0</td> </tr> </table> <p>For accesses to a memory region configured for an 8-bit data-bus width, the processor uses the <math>\overline{BE1}</math> and <math>\overline{BE0}</math> pins as A1 and A0 respectively.</p> <p>8-bit bus:</p> <table border="0"> <tr> <td><math>\overline{BE3}</math></td> <td>Not used (driven high or low)</td> <td></td> </tr> <tr> <td><math>\overline{BE2}</math></td> <td>Not used (driven high or low)</td> <td></td> </tr> <tr> <td><math>\overline{BE1}</math></td> <td>Address Bit 1 (A1)</td> <td></td> </tr> <tr> <td><math>\overline{BE0}</math></td> <td>Address Bit 0 (A0)</td> <td></td> </tr> </table>	$\overline{BE3}$	Byte Enable 3	enable D31:24	$\overline{BE2}$	Byte Enable 2	enable D23:16	$\overline{BE1}$	Byte Enable 1	enable D15:8	$\overline{BE0}$	Byte Enable 0	enable D7:0	$\overline{BE3}$	Byte High Enable ( $\overline{BHE}$ )	enable D15:8	$\overline{BE2}$	Not used (driven high or low)		$\overline{BE1}$	Address Bit 1 (A1)		$\overline{BE0}$	Byte Low Enable ( $\overline{BLE}$ )	enable D7:0	$\overline{BE3}$	Not used (driven high or low)		$\overline{BE2}$	Not used (driven high or low)		$\overline{BE1}$	Address Bit 1 (A1)		$\overline{BE0}$	Address Bit 0 (A0)	
$\overline{BE3}$	Byte Enable 3	enable D31:24																																				
$\overline{BE2}$	Byte Enable 2	enable D23:16																																				
$\overline{BE1}$	Byte Enable 1	enable D15:8																																				
$\overline{BE0}$	Byte Enable 0	enable D7:0																																				
$\overline{BE3}$	Byte High Enable ( $\overline{BHE}$ )	enable D15:8																																				
$\overline{BE2}$	Not used (driven high or low)																																					
$\overline{BE1}$	Address Bit 1 (A1)																																					
$\overline{BE0}$	Byte Low Enable ( $\overline{BLE}$ )	enable D7:0																																				
$\overline{BE3}$	Not used (driven high or low)																																					
$\overline{BE2}$	Not used (driven high or low)																																					
$\overline{BE1}$	Address Bit 1 (A1)																																					
$\overline{BE0}$	Address Bit 0 (A0)																																					
<b>W/R</b>	<b>O</b> S H(Z) R(0)	<b>WRITE/READ</b> is asserted for read requests and deasserted for write requests. The W/R signal changes in the same clock cycle as $\overline{ADS}$ . It remains valid for the entire access in non-pipelined regions. In pipelined regions, $W/\overline{R}$ is not guaranteed to be valid in the last cycle of a read access.																																				
<b>ADS</b>	<b>O</b> S H(Z) R(1)	<b>ADDRESS STROBE</b> indicates a valid address and the start of a new bus access. $\overline{ADS}$ is asserted for the first clock of a bus access.																																				
<b>READY</b>	<b>I</b> S(L) H(Z) R(Z)	<b>READY</b> is an input which signals the termination of a data transfer. $\overline{READY}$ is used to indicate that read data on the bus is valid or that a write-data transfer has completed. The $\overline{READY}$ signal works in conjunction with the internally programmed wait-state generator. If $\overline{READY}$ is enabled in a region, the pin is sampled after the programmed number of wait-states has expired. If the $\overline{READY}$ pin is deasserted, wait states continue to be inserted until $\overline{READY}$ becomes asserted. This is true for the $N_{RAD}$ , $N_{RDD}$ , $N_{WAD}$ and $N_{WDD}$ wait states. The $N_{XDA}$ wait states cannot be extended.																																				

Table 2. 80960CF Pin Description — External Bus Signals (Sheet 2 of 3)

Name	Type	Description
<b>BTERM</b>	I S(L) H(Z) R(Z)	<b>BURST TERMINATE</b> is an input which breaks up a burst access and causes another address cycle to occur. The $\overline{\text{BTERM}}$ signal works in conjunction with the internally programmed wait-state generator. If $\overline{\text{READY}}$ and $\overline{\text{BTERM}}$ are enabled in a region, the $\overline{\text{BTERM}}$ pin is sampled after the programmed number of wait states has expired. When $\overline{\text{BTERM}}$ is asserted, a new $\overline{\text{ADS}}$ signal is generated and the access is completed. The $\overline{\text{READY}}$ input is ignored when $\overline{\text{BTERM}}$ is asserted. $\overline{\text{BTERM}}$ must be externally synchronized to satisfy $\overline{\text{BTERM}}$ setup and hold times.
<b>WAIT</b>	O S H(Z) R(1)	<b>WAIT</b> indicates internal wait state generator status. $\overline{\text{WAIT}}$ is asserted when wait states are being caused by the internal wait state generator and not by the $\overline{\text{READY}}$ or $\overline{\text{BTERM}}$ inputs. $\overline{\text{WAIT}}$ can be used to derive a write-data strobe. $\overline{\text{WAIT}}$ can also be thought of as a $\overline{\text{READY}}$ output that the processor provides when it is inserting wait states.
<b>BLAST</b>	O S H(Z) R(0)	<b>BURST LAST</b> indicates the last transfer in a bus access. $\overline{\text{BLAST}}$ is asserted in the last data transfer of burst and non-burst accesses after the wait state counter reaches zero. $\overline{\text{BLAST}}$ remains asserted until the clock following the last cycle of the last data transfer of a bus access. If the $\overline{\text{READY}}$ or $\overline{\text{BTERM}}$ input is used to extend wait states, the $\overline{\text{BLAST}}$ signal remains asserted until $\overline{\text{READY}}$ or $\overline{\text{BTERM}}$ terminates the access.
<b>DT/R</b>	O S H(Z) R(0)	<b>DATA TRANSMIT/RECEIVE</b> indicates direction for data transceivers. $\text{DT}/\overline{\text{R}}$ is used in conjunction with $\overline{\text{DEN}}$ to provide control for data transceivers attached to the external bus. When $\text{DT}/\overline{\text{R}}$ is asserted, the signal indicates that the processor receives data. Conversely, when deasserted, the processor sends data. $\text{DT}/\overline{\text{R}}$ changes only while $\overline{\text{DEN}}$ is high.
<b>DEN</b>	O S H(Z) R(1)	<b>DATA ENABLE</b> indicates data cycles in a bus request. $\overline{\text{DEN}}$ is asserted at the start of the bus request first data cycle and is deasserted at the end of the last data cycle. $\overline{\text{DEN}}$ is used in conjunction with $\text{DT}/\overline{\text{R}}$ to provide control for data transceivers attached to the external bus. $\overline{\text{DEN}}$ remains asserted for sequential reads from pipelined memory regions. $\overline{\text{DEN}}$ is deasserted when $\text{DT}/\overline{\text{R}}$ changes.
<b>LOCK</b>	O S H(Z) R(1)	<b>BUS LOCK</b> indicates that an atomic read-modify-write operation is in progress. $\overline{\text{LOCK}}$ may be used to prevent external agents from accessing memory which is currently involved in an atomic operation. $\overline{\text{LOCK}}$ is asserted in the first clock of an atomic operation and deasserted in the clock cycle following the last bus access for the atomic operation. To allow the most flexibility for memory system enforcement of locked accesses, the processor acknowledges a bus hold request when $\overline{\text{LOCK}}$ is asserted. The processor performs DMA transfers while $\overline{\text{LOCK}}$ is active.
<b>HOLD</b>	I S(L) H(Z) R(Z)	<b>HOLD REQUEST</b> signals that an external agent requests access to the external bus. The processor asserts $\overline{\text{HOLDA}}$ after completing the current bus request. $\overline{\text{HOLD}}$ , $\overline{\text{HOLDA}}$ and $\overline{\text{BREQ}}$ are used together to arbitrate access to the processor's external bus by external bus agents.
<b>BOFF</b>	I S(L) H(Z) R(Z)	<b>BUS BACKOFF</b> , when asserted, suspends the current access and causes the bus pins to float. When $\overline{\text{BOFF}}$ is deasserted, the $\overline{\text{ADS}}$ signal is asserted on the next clock cycle and the access is resumed.

Table 2. 80960CF Pin Description — External Bus Signals (Sheet 3 of 3)

Name	Type	Description
<b>HOLDA</b>	<b>O</b> S H(1) R(Q)	<b>HOLD ACKNOWLEDGE</b> indicates to a bus requestor that the processor has relinquished control of the external bus. When <b>HOLDA</b> is asserted, the external address bus, data bus and bus control signals are floated. <b>HOLD</b> , $\overline{\text{BOFF}}$ , <b>HOLDA</b> and <b>BREQ</b> are used together to arbitrate access to the processor's external bus by external bus agents. Since the processor grants <b>HOLD</b> requests and enters the Hold Acknowledge state even while $\overline{\text{RESET}}$ is asserted, the state of the <b>HOLDA</b> pin is independent of the $\overline{\text{RESET}}$ pin.
<b>BREQ</b>	<b>O</b> S H(Q) R(0)	<b>BUS REQUEST</b> is asserted when the bus controller has a request pending. <b>BREQ</b> can be used by external bus arbitration logic in conjunction with <b>HOLD</b> and <b>HOLDA</b> to determine when to return mastership of the external bus to the processor.
<b>D/C</b>	<b>O</b> S H(Z) R(Z)	<b>DATA OR CODE</b> is asserted for a data request and deasserted for instruction requests. <b>D/C</b> has the same timing as $\overline{\text{W/R}}$ .
<b>DMA</b>	<b>O</b> S H(Z) R(Z)	<b>DMA ACCESS</b> indicates whether the bus request was initiated by the DMA controller. $\overline{\text{DMA}}$ is asserted for any DMA request. $\overline{\text{DMA}}$ is deasserted for all other requests.
<b>SUP</b>	<b>O</b> S H(Z) R(Z)	<b>SUPERVISOR ACCESS</b> indicates whether the bus request is issued while in supervisor mode. $\overline{\text{SUP}}$ is asserted when the request has supervisor privileges and is deasserted otherwise. $\overline{\text{SUP}}$ can be used to isolate supervisor code and data structures from non-supervisor requests.

**Table 3. 80960CF Pin Description — Processor Control Signals** (Sheet 1 of 2)

Name	Type	Description
<b>RESET</b>	I A(L) H(Z) R(Z)	<p><b>RESET</b> causes the chip to reset. When <math>\overline{\text{RESET}}</math> is asserted, all external signals return to the reset state. When <math>\overline{\text{RESET}}</math> is deasserted, initialization begins. When the 2-x clock mode is selected, <math>\overline{\text{RESET}}</math> must remain asserted for 32 CLKIN cycles before being deasserted to guarantee correct processor initialization. When the 1-x clock mode is selected, <math>\overline{\text{RESET}}</math> must remain asserted for 10,000 CLKIN cycles before being deasserted to guarantee correct processor initialization. The CLKMODE pin selects 1-x or 2-x input clock division of the CLKIN pin.</p> <p>The Hold Acknowledge bus state functions while the chip is reset. If the bus is in the Hold Acknowledge state when <math>\overline{\text{RESET}}</math> is asserted, the processor internally resets, but maintains the Hold Acknowledge state on external pins until the Hold request is removed. If a Hold request is made while the processor is in the reset state, the processor bus grants HOLDA and enters the Hold Acknowledge state.</p>
<b>FAIL</b>	O S H(Q) R(0)	<p><b>FAIL</b> indicates failure of the self-test performed at initialization. When <math>\overline{\text{RESET}}</math> is deasserted and initialization begins, the <math>\overline{\text{FAIL}}</math> pin is asserted. An internal self-test is performed as part of the initialization process. If this self-test passes, the <math>\overline{\text{FAIL}}</math> pin is deasserted; otherwise it remains asserted. The <math>\overline{\text{FAIL}}</math> pin is reasserted while the processor performs an external bus self-confidence test. If this self-test passes, the processor deasserts the <math>\overline{\text{FAIL}}</math> pin and branches to the user's initialization routine; otherwise the <math>\overline{\text{FAIL}}</math> pin remains asserted. Internal self-test and the use of the <math>\overline{\text{FAIL}}</math> pin can be disabled with the STEST pin.</p>
<b>STEST</b>	I S(L) H(Z) R(Z)	<p><b>SELF TEST</b> enables or disables the internal self-test feature at initialization. STEST is read on the rising edge of <math>\overline{\text{RESET}}</math>. When asserted, internal self-test and external bus confidence tests are performed during processor initialization. When deasserted, only the bus confidence tests are performed during initialization.</p>
<b>ONCE</b>	I A(L) H(Z) R(Z)	<p><b>ON CIRCUIT EMULATION</b>, when asserted, causes all outputs to be floated. <math>\overline{\text{ONCE}}</math> is continuously sampled while <math>\overline{\text{RESET}}</math> is low and is latched on the rising edge of <math>\overline{\text{RESET}}</math>. To place the processor in the ONCE state:</p> <ol style="list-style-type: none"> <li>(1) assert <math>\overline{\text{RESET}}</math> and <math>\overline{\text{ONCE}}</math> (order does not matter)</li> <li>(2) wait for at least 16 CLKIN periods in 2-x mode—or 10,000 CLKIN periods in 1-x mode—after <math>V_{\text{CC}}</math> and CLKIN are within operating specifications</li> <li>(3) deassert <math>\overline{\text{RESET}}</math></li> <li>(4) wait at least 32 CLKIN periods</li> </ol> <p>(The processor will now be latched in the ONCE state while <math>\overline{\text{RESET}}</math> is high.)</p> <p>To exit the ONCE state, bring <math>V_{\text{CC}}</math> and CLKIN to operating conditions, then assert <math>\overline{\text{RESET}}</math> and bring <math>\overline{\text{ONCE}}</math> high prior to deasserting <math>\overline{\text{RESET}}</math>.</p> <p>CLKIN must operate within the specified operating conditions until Step 4 completes. CLKIN may then be changed to DC to achieve the lowest possible ONCE mode leakage current.</p> <p><math>\overline{\text{ONCE}}</math> can be used by emulator products or board testers to effectively make an installed processor transparent in the board.</p>

Table 3. 80960CF Pin Description — Processor Control Signals (Sheet 2 of 2)

Name	Type	Description
<b>CLKIN</b>	<b>I</b> A(E) H(Z) R(Z)	<b>CLOCK INPUT</b> is an input for the external clock needed to run the processor. The external clock is internally divided as prescribed by the CLKMODE pin to produce PCLK2:1.
<b>CLKMODE</b>	<b>I</b> A(L) H(Z) R(Z)	<b>CLOCK MODE</b> selects the division factor applied to the external clock input (CLKIN). When CLKMODE is high, CLKIN is divided by one to create PCLK2:1 and the processor's internal clock. When CLKMODE is low, CLKIN is divided by two to create PCLK2:1 and the processor's internal clock. CLKMODE should be tied high or low in a system as the clock mode is not latched by the processor. If left unconnected, the processor internally pulls the CLKMODE pin low, enabling the 2-x clock mode.
<b>PCLK2:1</b>	<b>O</b> S H(Q) R(Q)	<b>PROCESSOR OUTPUT CLOCKS</b> provide a timing reference for all inputs and outputs. All input and output timings are specified in relation to PCLK2 and PCLK1. PCLK2 and PCLK1 are identical signals. Two output pins are provided to allow flexibility in the system's allocation of capacitive loading on the clock. PCLK2:1 may also be connected at the processor to form a single clock signal.
<b>V<sub>SS</sub></b>	–	<b>GROUND</b> connections must be connected externally to a V <sub>SS</sub> board plane.
<b>V<sub>CC</sub></b>	–	<b>POWER</b> connections must be connected externally to a V <sub>CC</sub> board plane.
<b>V<sub>CCPLL</sub></b>	–	<b>V<sub>CCPLL</sub></b> is a separate V <sub>CC</sub> supply pin for the phase lock loop used in 1-x clock mode. Connecting a simple lowpass filter to V <sub>CCPLL</sub> may help reduce clock jitter (T <sub>CP</sub> ) in noisy environments. Otherwise, V <sub>CCPLL</sub> should be connected to V <sub>CC</sub> .
<b>NC</b>	–	<b>NO CONNECT</b> pins must not be connected in a system.

Table 4. 80960CF Pin Description — DMA and Interrupt Unit Control Signals

Name	Type	Description
$\overline{\text{DREQ3:0}}$	I A(L) H(Z) R(Z)	<b>DMA REQUEST</b> is used to request a DMA transfer. Each of the four signals requests a transfer on a single channel. $\overline{\text{DREQ0}}$ requests channel 0, $\overline{\text{DREQ1}}$ requests channel 1, etc. When two or more channels are requested simultaneously, the channel with the highest priority is serviced first. Channel priority mode is programmable.
$\overline{\text{DACK3:0}}$	O S H(1) R(1)	<b>DMA ACKNOWLEDGE</b> indicates that a DMA transfer is being executed. Each of the four signals acknowledges a transfer for a single channel. $\overline{\text{DACK0}}$ acknowledges channel 0, $\overline{\text{DACK1}}$ acknowledges channel 1, etc. $\overline{\text{DACK3:0}}$ are asserted when the requesting device of a DMA is accessed.
$\overline{\text{EOP/TC3:0}}$	I/O A(L) H(Z/Q) R(Z)	<b>END OF PROCESS/TERMINAL COUNT</b> can be programmed as either an input ( $\overline{\text{EOP3:0}}$ ) or output ( $\overline{\text{TC3:0}}$ ), but not both. Each pin is individually programmable. When programmed as an input, $\overline{\text{EOPx}}$ causes termination of a current DMA transfer for the channel that corresponds to the $\overline{\text{EOPx}}$ pin. $\overline{\text{EOP0}}$ corresponds to channel 0, $\overline{\text{EOP1}}$ corresponds to channel 1, etc. When a channel is configured for source <i>and</i> destination chaining, the EOP pin for that channel causes termination of only the current buffer transferred and causes the next buffer to be transferred. $\overline{\text{EOP3:0}}$ are asynchronous inputs.  When programmed as an output, the channel's $\overline{\text{TCx}}$ pin indicates that the channel byte count has reached 0 and a DMA has terminated. $\overline{\text{TCx}}$ is driven with the same timing as $\overline{\text{DACKx}}$ during the last DMA transfer for a buffer. If the last bus request is executed as multiple bus accesses, $\overline{\text{TCx}}$ stays asserted for the entire bus request.
$\overline{\text{XINT7:0}}$	I A(E/L) H(Z) R(Z)	<b>EXTERNAL INTERRUPT PINS</b> cause interrupts to be requested. These pins can be configured in three modes:  <b>Dedicated Mode:</b> each pin is a dedicated external interrupt source. Dedicated inputs can be individually programmed to be level (low) or edge (falling) activated.  <b>Expanded Mode:</b> the eight pins act together as an 8-bit vectored interrupt source. The interrupt pins in this mode are level activated. Since the interrupt pins are active low, the vector number requested is the 1's complement of the positive logic value place on the port. This eliminates glue logic to interface to combinational priority encoders which output negative logic.  <b>Mixed Mode:</b> $\overline{\text{XINT7:5}}$ are dedicated sources and $\overline{\text{XINT4:0}}$ act as the five most significant bits of an expanded mode vector. The least significant bits are set to 010 internally.
$\overline{\text{NMI}}$	I A(E) H(Z) R(Z)	<b>NON-MASKABLE INTERRUPT</b> causes a non-maskable interrupt event to occur. $\overline{\text{NMI}}$ is the highest priority interrupt recognized. $\overline{\text{NMI}}$ is an edge (falling) activated source.

Figure 4. 80960CF PQFP Pinout—Top View (80960CF-33, -25, -16 Only)

### 3.4 Package Thermal Specifications

The 80960CF is specified for operation when  $T_C$  (case temperature) is within the range of 0°C–100°C for 33, 25, and 16 MHz and 0°C–85°C for 40 MHz.  $T_C$  may be measured in any environment to determine whether the 80960CF is within specified operating range. Case temperature should be measured at the center of the top surface, opposite the pins. Refer to Figure 5.

$T_A$  (ambient temperature) is calculated from  $\theta_{CA}$  (thermal resistance from case to ambient) using the equation:

$$T_A = T_C - P \cdot \theta_{CA}$$

Table 9 shows the maximum  $T_A$  allowable (without exceeding  $T_C$ ) at various airflows and operating frequencies ( $f_{PCLK}$ ).

Note that  $T_A$  is greatly improved by attaching fins or a heatsink to the package.  $P$  (maximum power consumption) is calculated by using the typical  $I_{CC}$  as tabulated in **Section 4.4, DC Specifications** and  $V_{CC}$  of 5 V.

Figure 5. Measuring 80960CF PGA and PQFP Case Temperature

Table 9. Maximum  $T_A$  at Various Airflows in  $^{\circ}\text{C}$  (PGA Package Only)

		Airflow-ft/min (m/sec)					
		0 (0)	200 (1.01)	400 (2.03)	600 (3.04)	800 (4.06)	1000 (5.07)
	$f_{\text{PCLK}}$ (MHz)						
$T_A$ with Heatsink*	40	20	40	58	60	66	68
	33	38	57	74	76	81	84
	25	50	65	79	81	85	87
	16	63	74	84	86	89	90
$T_A$ without Heatsink*	40	0	15	30	40	50	52
	33	18	33	47	57	66	67
	25	34	46	57	65	72	74
	16	51	60	68	74	80	81

**NOTES:**

\*0.285" high unidirectional heatsink (Al alloy 6061, 50 mil fin width, 150 mil center-to-center fin spacing).

**Table 10. 80960CF PGA Package Thermal Characteristics**

Thermal Resistance — °C/Watt						
Parameter	Airflow — ft./min (m/sec)					
	0 (0)	200 (1.01)	400 (2.03)	600 (3.07)	800 (4.06)	1000 (5.07)
$\theta$ Junction-to-Case (Case measured as shown in Figure 5)	1.5	1.5	1.5	1.5	1.5	1.5
$\theta$ Case-to-Ambient (No Heatsink)	17	14	11	9	7.1	6.6
$\theta$ Case-to-Ambient (With Heatsink)*	13	9	5.5	5	3.9	3.4

**NOTES:**

1. This table applies to 80960CF PGA plugged into socket or soldered directly to board.
  2.  $\theta_{JA} = \theta_{JC} + \theta_{CA}$
- \*0.285" high unidirectional heatsink (Al alloy 6061, 50 mil fin width, 150 mil center-to-center fin spacing).

**Table 11. 80960CF PQFP Package Thermal Characteristics**

Thermal Resistance — °C/Watt							
Parameter	Airflow — ft./min (m/sec)						
	0 (0)	50 (0.25)	100 (0.50)	200 (1.01)	400 (2.03)	600 (3.04)	800 (4.06)
$\theta$ Junction-to-Case (Case Measured as shown in Figure 5)	5	5	5	5	5	5	5
$\theta$ Case-to-Ambient (No Heatsink)	19	18	17	15	12	10	9

**NOTES:**

1. This table applies to 80960CF PQFP soldered directly to board.
2.  $\theta_{JA} = \theta_{JC} + \theta_{CA}$

### 3.5 Stepping Register Information

Upon reset, register g0 contains die stepping information (Figure 6). The most significant byte contains ASCII 0; the upper middle byte contains an ASCII C; the lower middle byte contains an ASCII F. The least significant byte contains the stepping number in

ASCII. g0 retains this information until it is overwritten by the user program. Table 12 contains a cross reference of the number in the least significant byte of register g0 to the die stepping number.

Figure 6. Register g0

Table 12. Die Stepping Cross Reference

g0 Least Significant Byte	Die Stepping
01	A
02	B
03	C
04	D
05	E

### 3.6 Sources for Accessories

The following is a list of suggested sources for 80960CF accessories. This is neither an endorsement nor a warranty of the performance of any of the listed products and/or companies.

#### Sockets

1. 3M Textool Test and Interconnection Products  
6801 River Place Blvd. Mailstop 130-3N-29  
Austin, TX 78726-9000  
(800) 328-0411
2. Augat, Inc. Interconnection Products Group  
452 John Dietsch Blvd.  
Attleboro Falls, MA 02763  
(508) 699-7646
3. Concept Mfg., Inc. (Decoupling Sockets)  
400 Walnut St. Suite 609  
Redwood City, CA 94063  
(415) 365-1162 FAX: (415)265-1164

#### Heatsinks/Fins

1. Thermalloy, Inc.  
2021 West Valley View Lane  
Dallas, TX 75234  
(214) 243-4321  
FAX: (214) 241-4656
2. Wakefield Engineering  
60 Audubon Road  
Wakefield, MA 01880  
(617) 245-5900

## 4.0 ELECTRICAL SPECIFICATIONS

### 4.1 Absolute Maximum Ratings

Parameter	Maximum Rating
Storage Temperature.....	-65°C to +150°C
Case Temperature Under Bias.....	-65°C to +110°C
Supply Voltage wrt. $V_{SS}$ .....	-0.5 V to + 6.5 V
Voltage on Other Pins wrt. $V_{SS}$ .....	-0.5 V to $V_{CC} + 0.5$ V

**NOTICE:** This document contains preliminary information on new products in production. The specifications are subject to change without notice. Verify with your local Intel sales office that you have the latest datasheet before finalizing a design.

**\*WARNING:** *Stressing the device beyond the “Absolute Maximum Ratings” may cause permanent damage. These are stress ratings only. Operation beyond the “Operating Conditions” is not recommended and extended exposure beyond the “Operating Conditions” may affect device reliability.*

### 4.2 Operating Conditions

**Table 13. Operating Conditions**

Symbol	Parameter	Min	Max	Units	Notes
$V_{CC}$	Supply Voltage			V	
	80960CF-40	4.75	5.25		
	80960CF-33	4.50	5.50		
	80960CF-25	4.50	5.50		
	80960CF-16	4.50	5.50		
$f_{CLK2x}$	Input Clock Frequency (2-x Mode)			MHz	
	80960CF-40	0	80		
	80960CF-33	0	66		
	80960CF-25	0	50		
	80960CF-16	0	32		
$f_{CLK1x}$	Input Clock Frequency (1-x Mode)			MHz	(1)
	80960CF-40	8	40		
	80960CF-33	8	33		
	80960CF-25	8	25		
	80960CF-16	8	16		
$T_C$	Case Temp Under Bias			°C	
	PGA Pkg. (80960CF-40)	0	85		
	PGA Pkg. (80960CF-33, -25, -16 Only)	0	100		
	196-Pin PQFP (80960CF-33, -25, -16 Only)	0	100		

**NOTES:**

1. When in the 1-x input clock mode, CLKIN is an input to an internal phase-locked loop and must maintain a minimum frequency of 8 MHz for proper processor operation. However, in the 1-x mode, CLKIN may still be stopped when the processor is in a reset condition. If CLKIN is stopped, the specified RESET low time must be provided once CLKIN restarts and has stabilized.

### 4.3 Recommended Connections

Power and ground connections must be made to multiple  $V_{CC}$  and  $V_{SS}$  (GND) pins. Every 80960CF-based circuit board should include power ( $V_{CC}$ ) and ground ( $V_{SS}$ ) planes for power distribution. Every  $V_{CC}$  pin must be connected to the power plane, and every  $V_{SS}$  pin must be connected to the ground plane. Pins identified as “NC” **must not** be connected in the system.

Liberal decoupling capacitance should be placed near the 80960CF. The processor can cause transient power surges when its numerous output buffers transition, particularly when connected to large capacitive loads.

Low inductance capacitors and interconnects are recommended for best high frequency electrical

performance. Inductance can be reduced by shortening the board traces between the processor and decoupling capacitors as much as possible. Capacitors specifically designed for PGA packages will offer the lowest possible inductance.

For reliable operation, always connect unused inputs to an appropriate signal level. In particular, any unused interrupt ( $\overline{XINT}$ ,  $\overline{NMI}$ ), DMA ( $\overline{DREQ}$ ), or  $\overline{BTERM}$  input should be connected to  $V_{CC}$  through a pull-up resistor. Pull-up resistors should be in the range of 20 K $\Omega$  for each pin tied high. If  $\overline{READY}$  or  $\overline{HOLD}$  are not used, the unused input should be connected to ground. **N.C. pins must always remain unconnected.** For additional information refer to the *i960<sup>®</sup> Cx Microprocessor User's Manual* (270710).

### 4.4 DC Specifications

**Table 14. DC Characteristics** (Sheet 1 of 2)

(80960CF-40, 33, -25, -16 under the conditions described in **Section 4.2, Operating Conditions.**)

Symbol	Parameter	Min	Max	Units	Notes
$V_{IL}$	Input Low Voltage for all pins except $\overline{RESET}$	- 0.3	+0.8	V	
$V_{IH}$	Input High Voltage for all pins except $\overline{RESET}$	2.0	$V_{CC} + 0.3$	V	
$V_{OL}$	Output Low Voltage		0.45	V	$I_{OL} = 5 \text{ mA}$
$V_{OH}$	Output High Voltage $I_{OH} = -1 \text{ mA}$ $I_{OH} = -200 \mu\text{A}$	2.4 $V_{CC} - 0.5$		V V	
$V_{ILR}$	Input Low Voltage for $\overline{RESET}$	- 0.3	1.5	V	
$V_{IHR}$	Input High Voltage for $\overline{RESET}$	3.5	$V_{CC} + 0.3$	V	

#### NOTES:

1. No pullup or pulldown.
2. These pins have internal pullup resistors.
3. These pins have internal pulldown resistors.
4. Measured at worst case frequency,  $V_{CC}$  and temperature, with device operating and outputs loaded to the test conditions described in **Section 4.5.1, AC TEST CONDITIONS.**
5.  $I_{CC}$  Typical is not tested.
6. Output Capacitance is the capacitive load of a floating output.
7.  $\overline{CLKMODE}$  pin has a pulldown resistor only when  $\overline{ONCE}$  pin is deasserted.

**Table 14. DC Characteristics** (Sheet 2 of 2)

 (80960CF-40, 33, -25, -16 under the conditions described in **Section 4.2, Operating Conditions.**)

Symbol	Parameter	Min	Max	Units	Notes

$T_{IH8}$	RESET Input Hold (1-x Clock Mode)	$T/4 + 1$		ns	(14)

**NOTES:**

- See **Section 4.5.2, AC TIMING WAVEFORMS** for waveforms and definitions.
- See Figure 16 for capacitive derating information for output delays and hold times.
- See Figure 17 for capacitive derating information for rise and fall times.
- Where N is the number of NRAD, NRDD, NWAD or NWDD wait states that are programmed in the Bus Controller Region Table. WAIT never goes active when there are no wait states in an access.
- N = Number of wait states inserted with READY.
- Output Data and/or DT/R may be driven indefinitely following a cycle if there is no subsequent bus activity.
- Since asynchronous inputs are synchronized internally by the 80960CF, they have no required setup or hold times to be recognized and for proper operation. However, to guarantee recognition of the input at a particular edge of PCLK2:1, the setup times shown must be met. Asynchronous inputs must be active for at least two consecutive PCLK2:1 rising edges to be seen by the processor.
- These specifications are guaranteed by the processor.
- These specifications must be met by the system for proper operation of the processor.
- This timing is dependent upon the loading of PCLK2:1. Use the derating curves of **Section 4.5.3, DERATING CURVES** to adjust the timing for PCLK2:1 loading.
- In the 1-x input clock mode, the maximum input clock period is limited to 125 ns while the processor is operating. When the processor is in reset, the input clock may stop even in 1-x mode.
- When in the 1-x input clock mode, these specifications assume a stable input clock with a period variation of less than  $\pm 0.1\%$  between adjacent cycles.
- In 2-x clock mode, RESET is an asynchronous input which has no required setup and hold time for proper operation. However, to guarantee the device exits reset synchronized to a particular clock edge, the RESET pin must meet setup and hold times to the falling edge of the CLKIN. (See Figure 23.)
- In 1-x clock mode, RESET is an asynchronous input which has no required setup and hold time for proper operation. However, to guarantee the device exits reset synchronized to a particular clock edge, the RESET pin must meet setup and hold times to the rising edge of the CLKIN. (See Figure 24.)
- The interrupt pins are synchronized internally by the 80960CF. They have no required setup or hold times for proper operation. These pins are sampled by the interrupt controller every other clock and must be active for at least three consecutive PCLK2:1 rising edges when asserting them asynchronously. To guarantee recognition at a particular clock edge, the setup and hold times shown must be met for two consecutive PCLK2:1 rising edges.

**4.5.1 AC TEST CONDITIONS**

The AC Specifications in Section 4.5 are tested with the 50 pF load shown in Figure 7. Figure 16 shows how timings vary with load capacitance.

Specifications are measured at the 1.5V crossing point, unless otherwise indicated. Input waveforms are assumed to have a rise and fall time of  $\leq 2$  ns from 0.8V to 2.0V. See **Section 4.5.2, AC TIMING WAVEFORMS** for AC specification definitions, test points and illustrations.

Figure 7. AC Test Load

4.5.2 AC TIMING WAVEFORMS

Figure 9. CLKIN Waveform

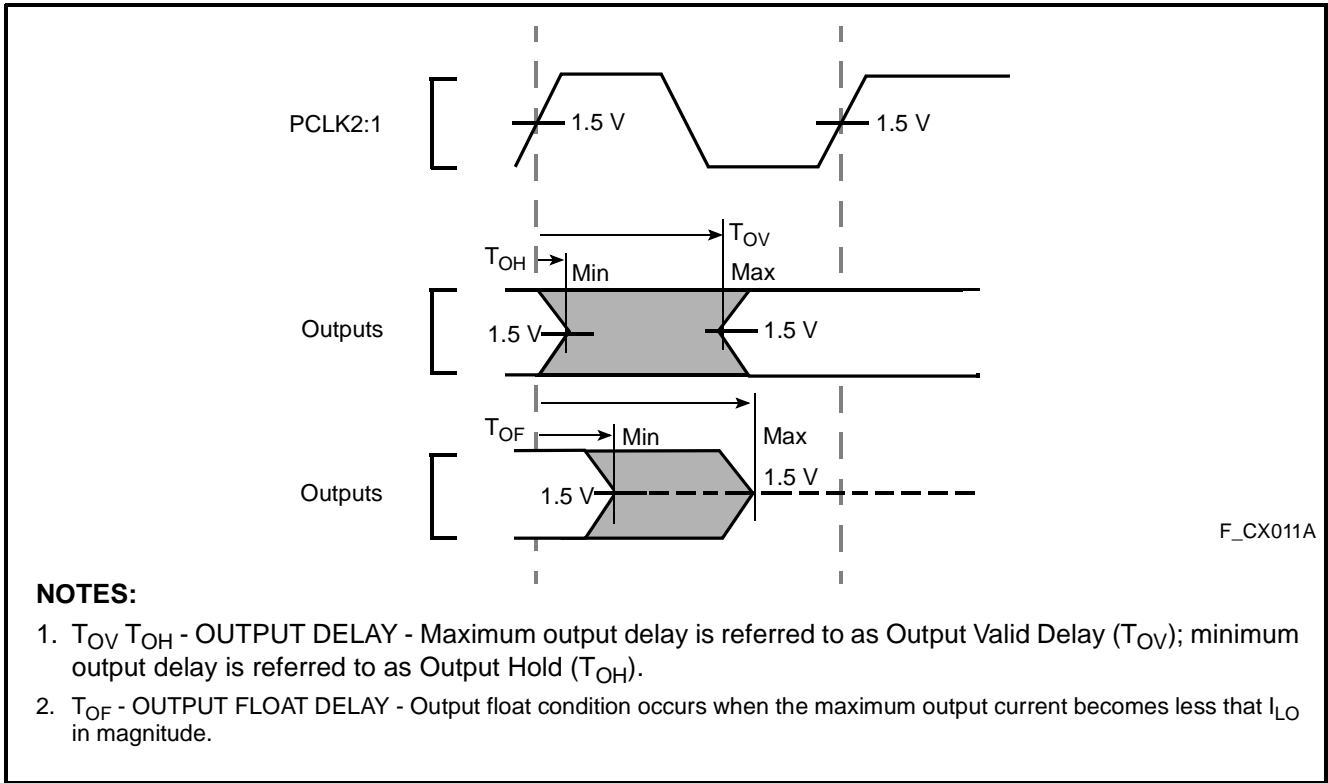

Figure 10. Output Delay and Float Waveform

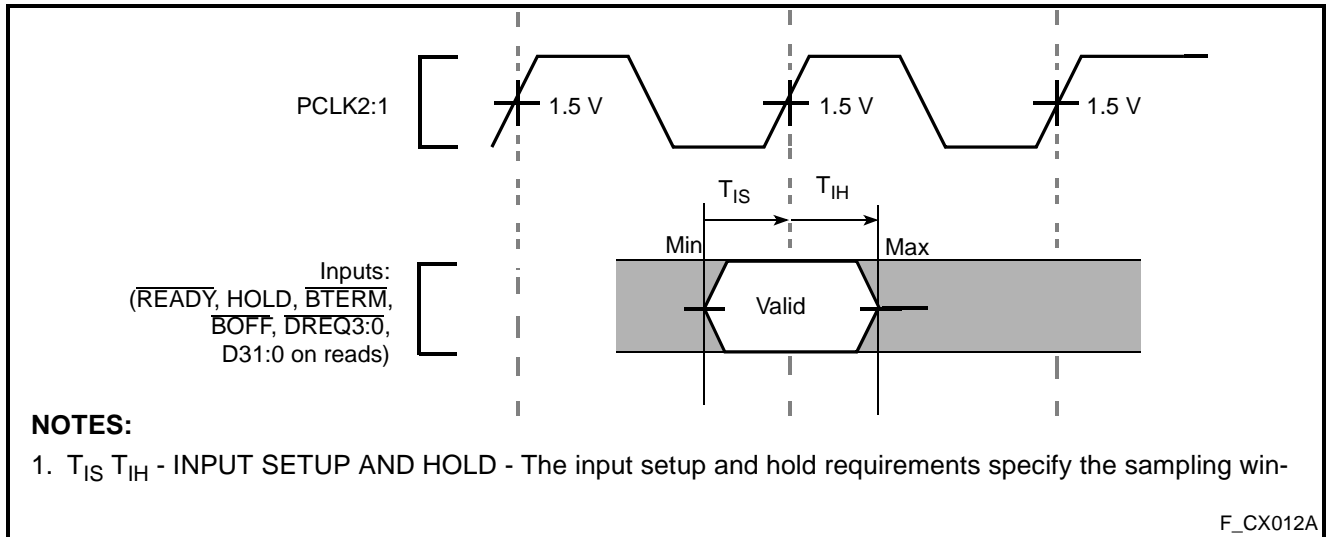

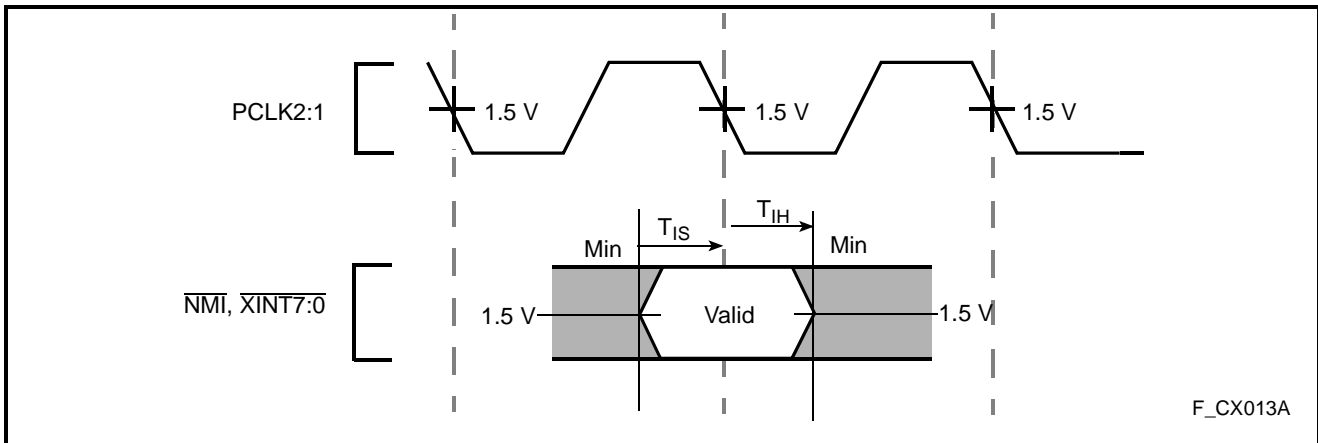

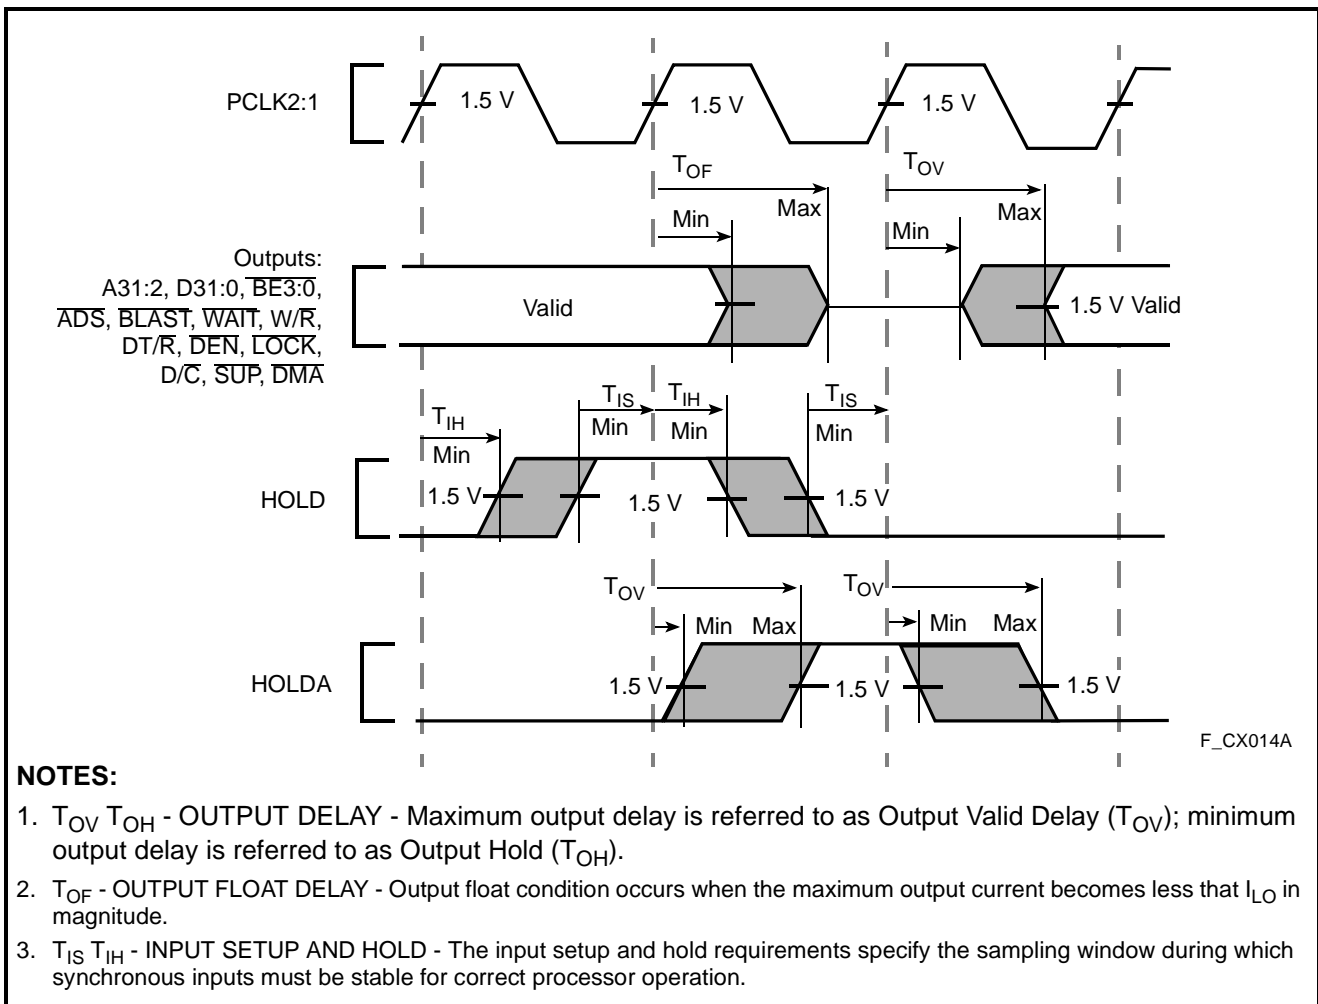

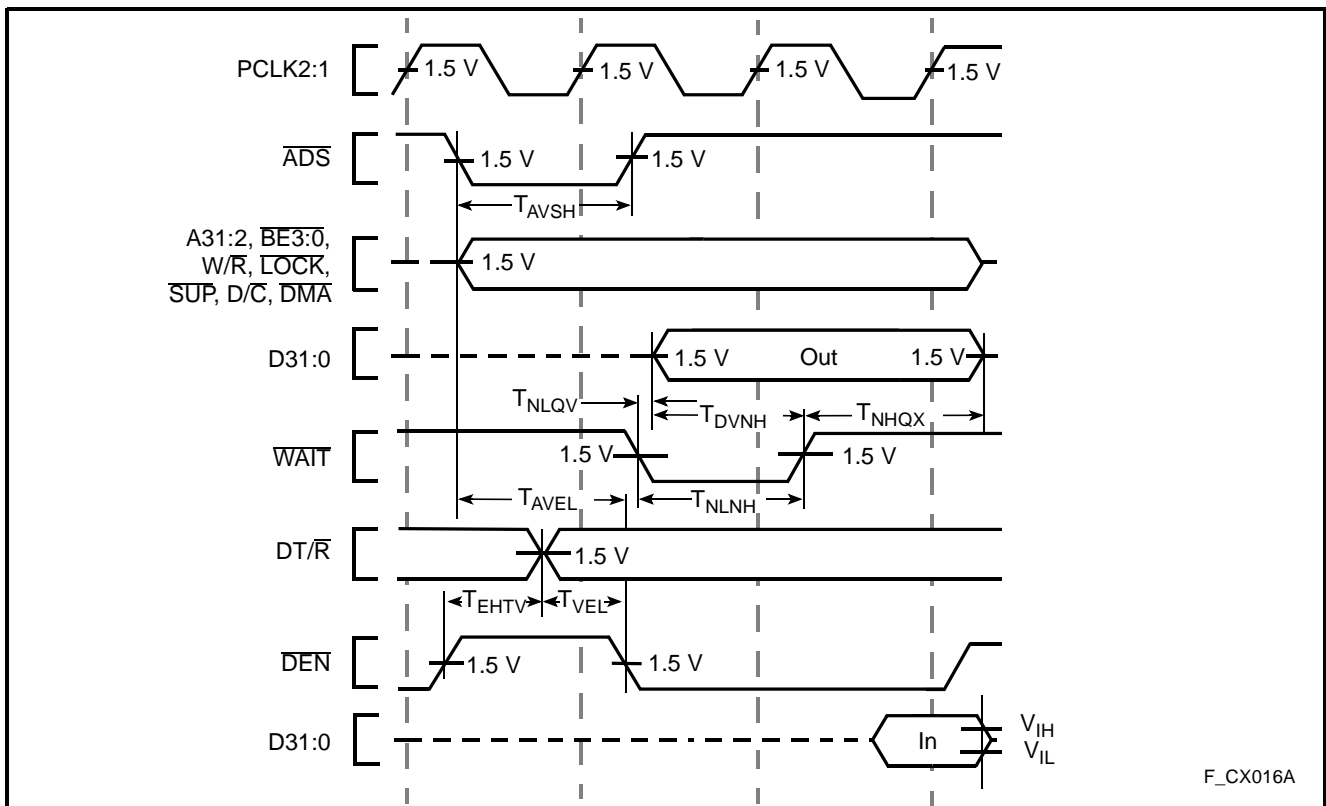

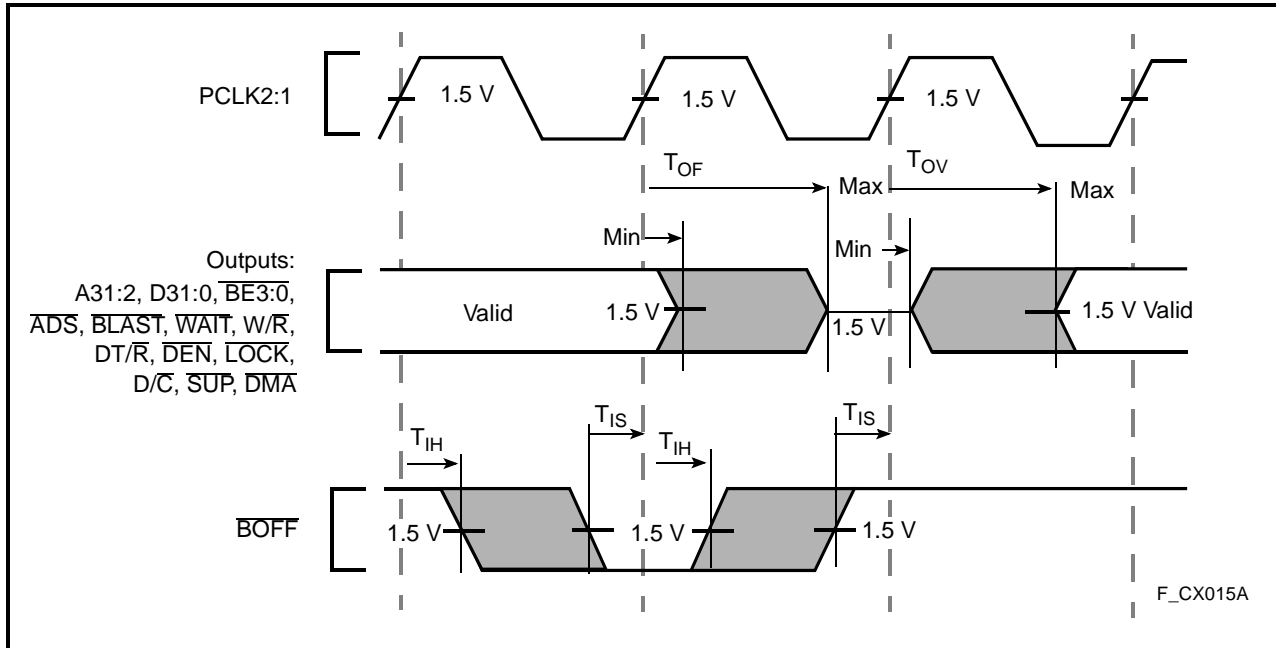

Figure 11. Input Setup and Hold Waveform

 Figure 12.  $\overline{\text{NMI}}$ , XINT7:0 Input Setup and Hold Waveform

**NOTES:**

1.  $T_{OV}$   $T_{OH}$  - OUTPUT DELAY - Maximum output delay is referred to as Output Valid Delay ( $T_{OV}$ ); minimum output delay is referred to as Output Hold ( $T_{OH}$ ).
2.  $T_{OF}$  - OUTPUT FLOAT DELAY - Output float condition occurs when the maximum output current becomes less than  $I_{LO}$  in magnitude.
3.  $T_{IS}$   $T_{IH}$  - INPUT SETUP AND HOLD - The input setup and hold requirements specify the sampling window during which synchronous inputs must be stable for correct processor operation.

### 5.0 RESET, BACKOFF AND HOLD ACKNOWLEDGE

Table 19 lists the condition of each processor output pin while  $\overline{\text{RESET}}$  is asserted (low). Table 20 lists the condition of each processor output pin while  $\text{HOLDA}$  is asserted (high).

In Table 20, with regard to bus output pin state only, the Hold Acknowledge state takes precedence over the reset state. Although asserting the  $\overline{\text{RESET}}$  pin internally resets the processor, the processor’s bus output pins do not enter the reset state if Hold Acknowledge has been granted to a previous HOLD request ( $\text{HOLDA}$  is active). Furthermore, the processor grants new HOLD requests and enters the Hold Acknowledge state even while in reset.

For example, if HOLD is asserted while  $\text{HOLDA}$  is inactive and the processor is in the reset state, the processor’s bus pins enter the Hold Acknowledge state and  $\text{HOLDA}$  is granted. The processor is not able to perform memory accesses until the HOLD request is removed, even if the  $\overline{\text{RESET}}$  pin is brought high. This operation is provided to simplify boot-up synchronization among multiple processors sharing the same bus.

**Table 19. Reset Conditions**

Pins	State During Reset (HOLDA inactive)
A31:2	Floating
D31:0	Floating
$\overline{\text{BE}}3:0$	Driven high (Inactive)
$\text{W}/\overline{\text{R}}$	Driven low (Read)
$\overline{\text{ADS}}$	Driven high (Inactive)
$\overline{\text{WAIT}}$	Driven high (Inactive)
$\overline{\text{BLAST}}$	Driven low (Active)
$\text{DT}/\overline{\text{R}}$	Driven low (Receive)
$\overline{\text{DEN}}$	Driven high (Inactive)
$\overline{\text{LOCK}}$	Driven high (Inactive)
BREQ	Driven low (Inactive)
$\text{D}/\overline{\text{C}}$	Floating
$\overline{\text{DMA}}$	Floating
$\overline{\text{SUP}}$	Floating
$\overline{\text{FAIL}}$	Driven low (Active)
$\overline{\text{DACK}}3:0$	Driven high (Inactive)
$\overline{\text{EOP}}3:0/\overline{\text{TC}}3:0$	Floating (Set to input mode)

**Table 20. Hold Acknowledge and Backoff Conditions**

Pins	State During HOLDA
A31:2	Floating
D31:0	Floating
$\overline{\text{BE}}3:0$	Floating
$\text{W}/\overline{\text{R}}$	Floating
$\overline{\text{ADS}}$	Floating
$\overline{\text{WAIT}}$	Floating
$\overline{\text{BLAST}}$	Floating
$\text{DT}/\overline{\text{R}}$	Floating
$\overline{\text{DEN}}$	Floating
$\overline{\text{LOCK}}$	Floating
BREQ	Driven (High or low)
$\text{D}/\overline{\text{C}}$	Floating
$\overline{\text{DMA}}$	Floating
$\overline{\text{SUP}}$	Floating
$\overline{\text{FAIL}}$	Driven high (Inactive)
$\overline{\text{DACK}}3:0$	Driven high (Inactive)
$\overline{\text{EOP}}3:0/\overline{\text{TC}}3:0$	Driven (If output)

## 7.0 REVISION HISTORY

This is a new data sheet for the 80960CF-40 product. It is derived from the 80960CF-33, -25, -16 data sheet. Aside from a few minor edits, only the AC Characteristics differ from the 80960CF-33, -25, -16 data sheet.
