### Functional Description

The CY7C132/CY7C136/CY7C142 and CY7C146 are high-speed CMOS 2K by 8 dual-port static RAMs. Two ports are provided to permit independent access to any location in memory. The CY7C132/ CY7C136 can be utilized as either a standalone 8-bit dual-port static RAM or as a MASTER dual-port RAM in conjunction with the CY7C142/CY7C146 SLAVE dual-port device in systems requiring 16-bit or greater word widths. It is the solution to applications requiring shared or buffered data such as cache memory for DSP, bit-slice, or multiprocessor designs.

Each port has independent control pins; chip enable ( $\overline{CE}$ ), write enable ( $R/\overline{W}$ ), and output enable ( $\overline{OE}$ ). **BUSY** flags are provided on each port. In addition, an interrupt flag (**INT**) is provided on each port of the 52-pin PLCC version. **BUSY** signals that the port is trying to access the same location currently being accessed by the other port. On the PLCC version, **INT** is an interrupt flag indicating that data has been placed in a unique location (7FF for the left port and 7FE for the right port).

An automatic power-down feature is controlled independently on each port by the chip enable ( $\overline{CE}$ ) pins.

The CY7C132/CY7C142 are available in 48-pin DIP. The CY7C136/CY7C146 are available in 52-pin PLCC and PQFP.

### Pin Configuration

#### Notes:

1. CY7C132/CY7C136 (Master): **BUSY** is open drain output and requires pull-up resistor. CY7C142/CY7C146 (Slave): **BUSY** is input.
2. Open drain outputs; pull-up resistor required.

**Notes:**

- Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V and output loading of the specified I<sub>OL</sub>/I<sub>OH</sub> and 30-pF load capacitance.
- AC test conditions use V<sub>OH</sub> = 1.6V and V<sub>OL</sub> = 1.4V.
- At any given temperature and voltage condition for any given device, t<sub>HZCE</sub> is less than t<sub>LZCE</sub> and t<sub>HZOE</sub> is less than t<sub>LZOE</sub>.
- t<sub>LZCE</sub>, t<sub>LZWE</sub>, t<sub>HZOE</sub>, t<sub>LZOE</sub>, t<sub>HZCE</sub>, and t<sub>HZWE</sub> are tested with C<sub>L</sub> = 5pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady-state voltage.
- The internal write time of the memory is defined by the overlap of  $\overline{CE}$  LOW and R/ $\overline{W}$  LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
- These parameters are measured from the input signal changing, until the output pin goes to a high-impedance state.
- CY7C142/CY7C146 only.
- A write operation on Port A, where Port A has priority, leaves the data on Port B's outputs undisturbed until one access time after one of the following:  
  - $\overline{BUSY}$  on Port B goes HIGH.
  - Port B's address toggled.
  - $\overline{CE}$  for Port B is toggled.
  - R/ $\overline{W}$  for Port B is toggled during valid read.
- 52-pin PLCC and PQFP versions only.
