### GENERAL DESCRIPTION

The REF-02 precision voltage reference provides a stable +5V output which can be adjusted over a  $\pm 6\%$  range with minimal effect on temperature stability. Single-supply operation over an input voltage range of  $7\text{V}$  to  $40\text{V}$ , low current drain of  $1\text{mA}$ , and excellent temperature stability are achieved with an improved bandgap design. Low cost, low noise, and low power make the REF-02 an excellent choice whenever a stable voltage reference is required. Applications include D/A and A/D converters, portable instrumentation, and digital voltmeters. The versatility of the REF-02 is enhanced by its use as a monolithic temperature transducer. For +10V references, see the REF-01 and REF-10 data sheets.

- Guaranteed by design.
- Line and Load Regulation specifications include the effect of self heating.
- Limit current in or out of pin 3 to 50nA and capacitance on pin 3 to 30pF.
- $\Delta V_{OT}$  is defined as the absolute difference between the maximum output voltage and the minimum output voltage over the specified temperature range expressed as a percentage of 5V.

$$\Delta V_{OT} = \left| \frac{V_{MAX} - V_{MIN}}{5V} \right| \times 100$$

- $\Delta V_{OT}$  specification applies trimmed to +5.000V or untrimmed.
- $TCV_O$  is defined as  $\Delta V_{OT}$  divided by the temperature range, i.e.,

$$TCV_O = \frac{\Delta V_{OT}}{70^\circ C}$$

- Sample Tested.
- During sink current test the driver meets the output voltage specified.

**OUTPUT ADJUSTMENT**

The REF-02 trim terminal can be used to adjust the output voltage over a  $5V \pm 300mV$  range. This feature allows the system designer to trim system errors by setting the reference to a voltage other than 5V. Of course, the output can also be set to exactly 5.000V or to 5.12V for binary applications.

Adjustment of the output does not significantly affect the temperature performance of the device. Typically, the temperature coefficient change is 0.7ppm/°C for 100mV of output adjustment.

TYPICAL TEMPERATURE VOLTAGE OUTPUT vs TEMPERATURE (REF-02A)

REFERENCE STACK WITH EXCELLENT LINE REGULATION

Two REF-01's and one REF-02 can be stacked to yield 5.000V, 15.000V and 25.000V outputs. An additional advantage of this circuit is near-perfect line regulation of the 5.0V and 15.0V outputs. A 27V to 55V input change produces an output change which is less than the noise voltage of the devices. A load bypass resistor (R<sub>B</sub>) provides a path for the supply current (I<sub>SY</sub>) of the 15.000V regulator.

In general, any number of REF-01's and REF-02's can be stacked this way. For example, ten devices will yield ten outputs in 5V or 10V steps. The line voltage can range from 100V to 130V. However, care must be taken to ensure that the total load currents do not exceed the maximum usable current (typically 21mA).

- REF-02 SHOULD BE THERMALLY CONNECTED TO SUBSTANCE BEING HEATED.
- NUMBERS IN PARENTHESES ARE FOR A SETPOINT TEMPERATURE OF 60° C.
- R<sub>3</sub> = R<sub>1</sub>/R<sub>2</sub>/R<sub>6</sub>

## PRECISION CURRENT SOURCE

A current source with 35V output compliance and excellent output impedance can be obtained using this circuit. REF-02 (2) keeps the line voltage and power dissipation constant in device (1); the only important error consideration at room temperature is the negative supply rejection of the op amp. The typical  $3\mu\text{V/V}$  PSRR of the OP-02E will create a 20ppm change ( $3\mu\text{V/V} \times 35\text{V}/5\text{V}$ ) in output current over a 35V range. For example, a 5mA current source can be built ( $R = 1\text{k}\Omega$ ) with  $350\text{M}\Omega$  output impedance.

$$R_O = \frac{35\text{V}}{20 \times 10^{-6} \times 5\text{mA}}$$

## SUPPLY BYPASSING

For best results, it is recommended that the power supply pin is bypassed with a  $0.1\mu\text{F}$  disc ceramic capacitor.
